The Possibility (and Limitation) of Tracing Large Scale T and S Anomalies

Sunke Schmidtke, Jürgen Fischer

EURO ARGO: A new European Research Infrastructure

Work in Progress

General ideas/hints

What is possible?

What is not possible?

What might be done in future?

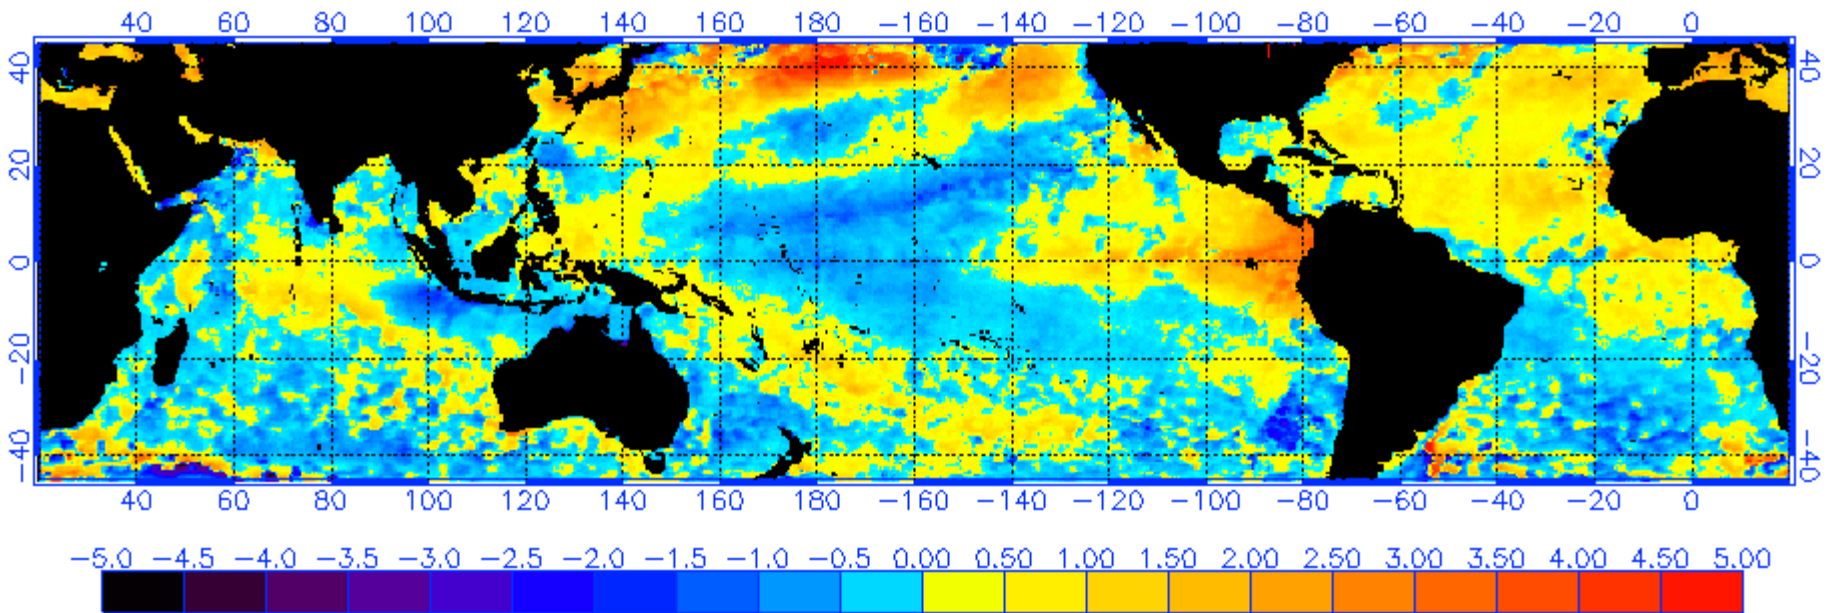

Tracing Large Scale T and S Anomalies

What are large scale anomalies?

El Niño NOAA/NESDIS SST Anomaly (degrees C), 8/4/2008

Tracing Large Scale T and S Anomalies

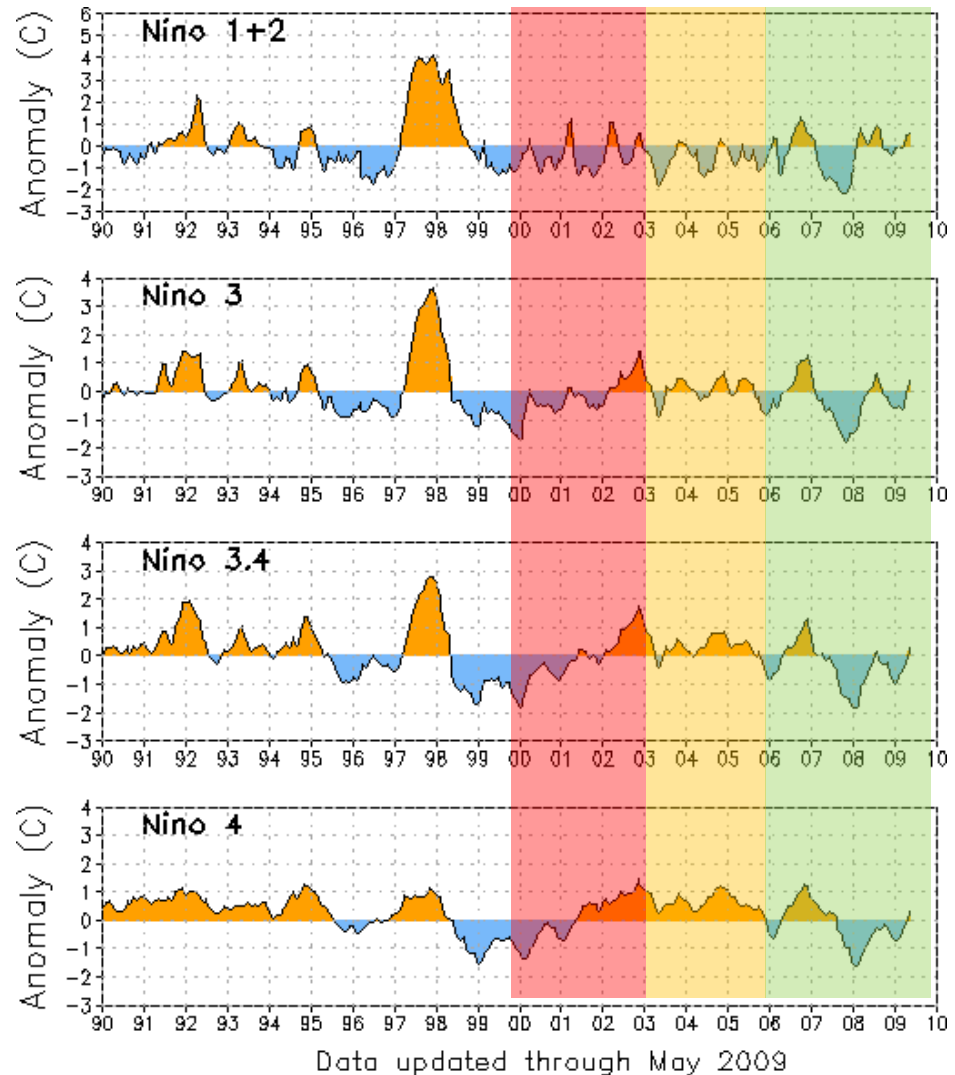

El Niño - SST

Peru

Eq. East Pacific

Eq. Pacific

Eq. West Pacific

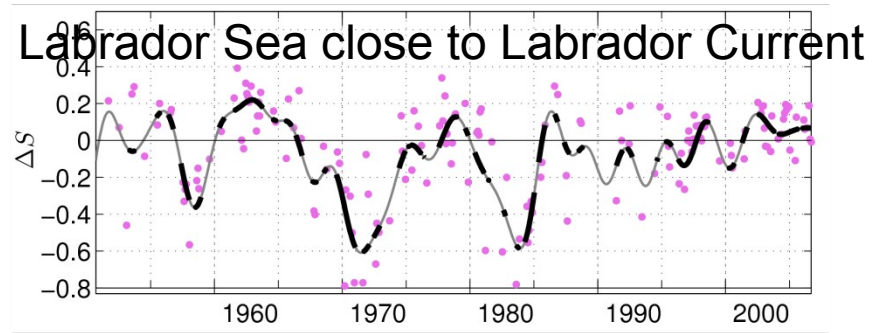

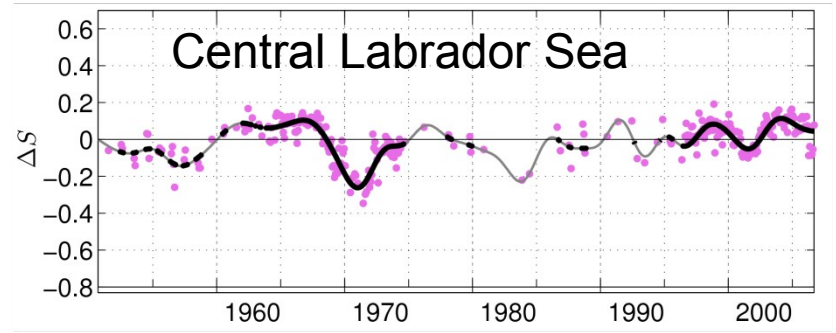

NCEP, Climate Prediction Center (CPC)

Tracing Large Scale T and S Anomalies

GSA 70's and beyond

Dickson et al. (1988)/ Dietrich et al. (1980)

Schmidt and Send (in preparation)

Tracing Large Scale T and S Anomalies

Why only large scale?

What is limiting anomaly tracking?

Limitation and Sampling Bias

„3°x3° network would yield a formal error of estimation for near surface temperature of less than 0.5°C”.

For salinity this would be ... ?

- Less accurate data
- More blank data
- False data

Other problems (for more remote areas)!

Limitation and Sampling Bias - eddies

Eddy in Labrador Sea T/S Section

Potential Temperature

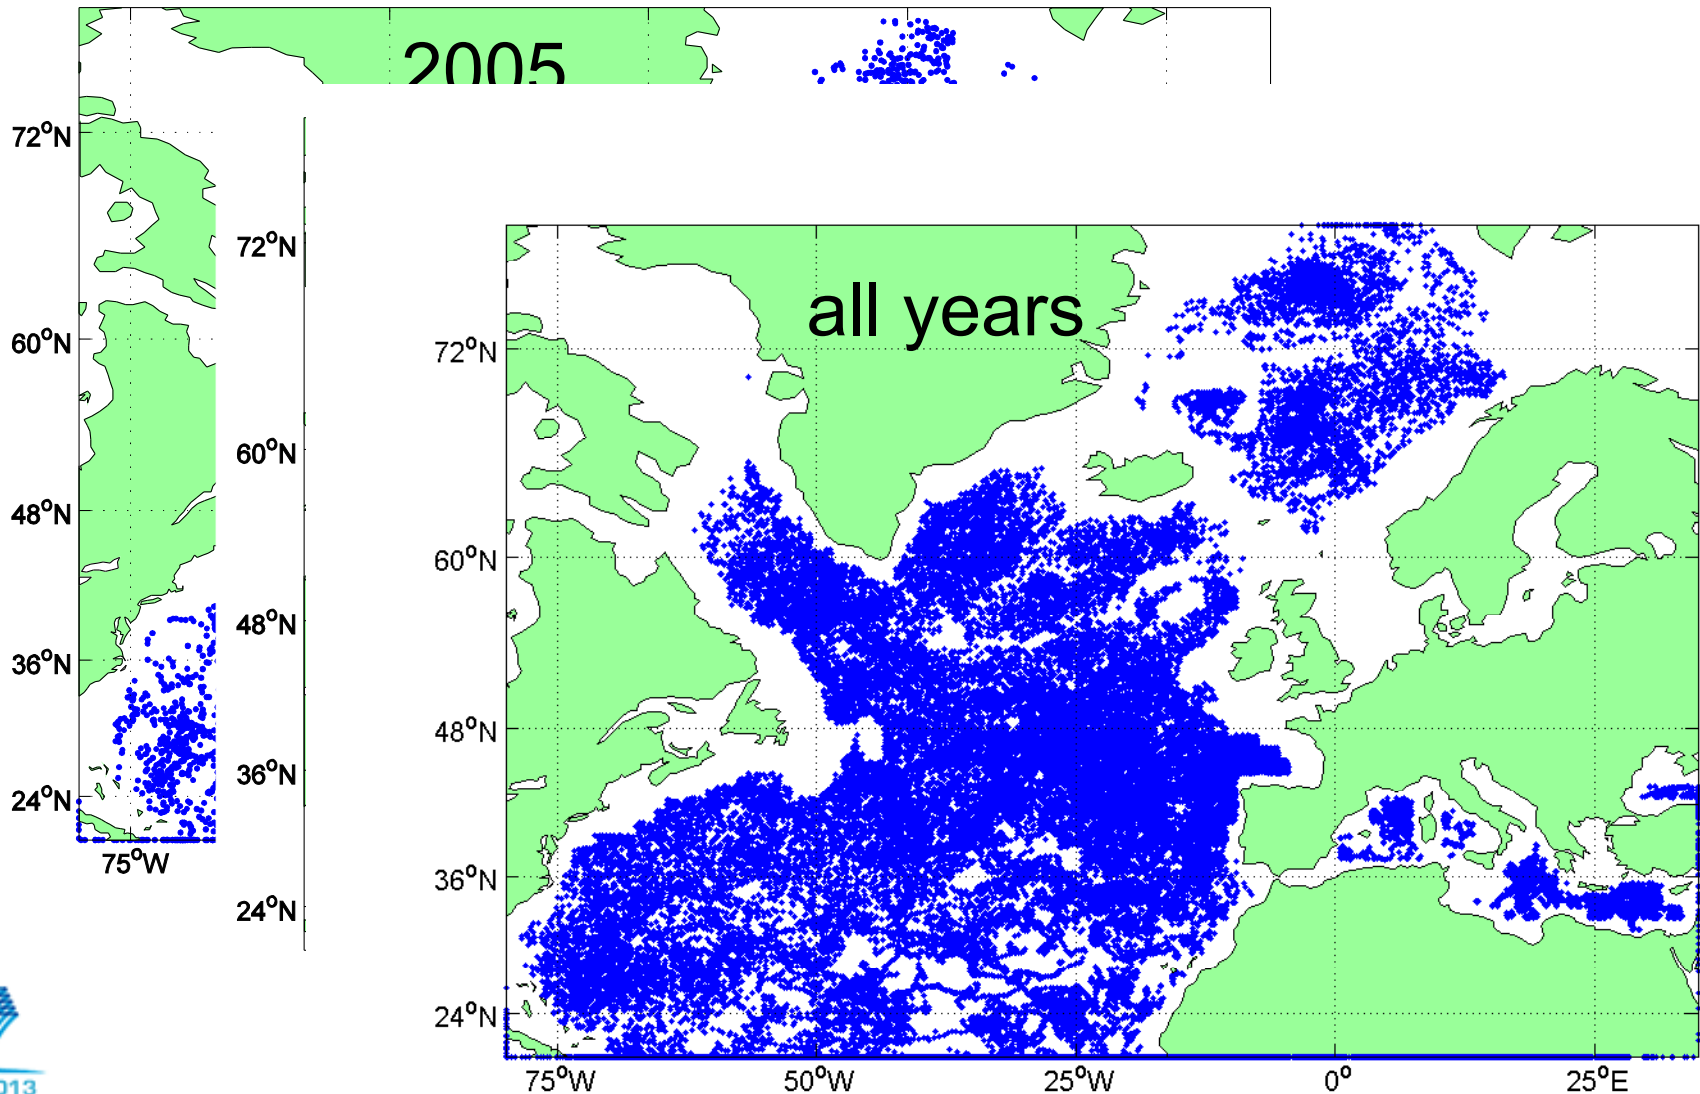

Salinity

T. Rykova und F. Straneo (2006)

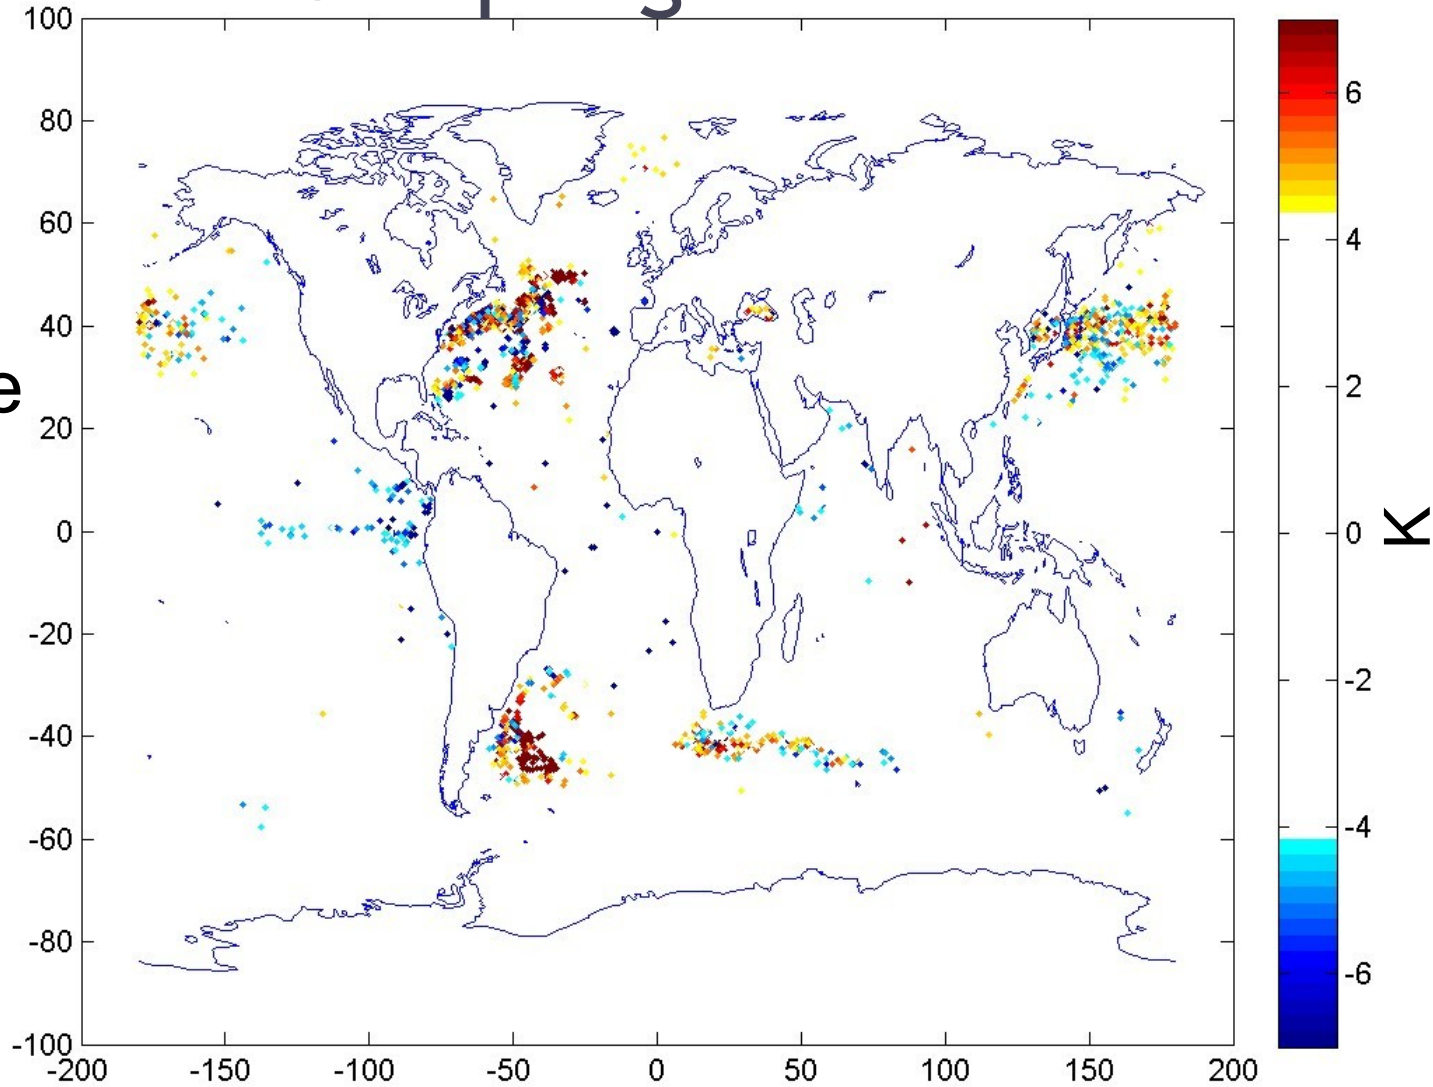

Limitation and Sampling Bias - sills ...

Limitation and Sampling Bias - fronts...

Temperature difference to monthly climatology

Limitation and Sampling Bias

- over sampling of eddies and similar features due to scientific significance + trapping of floats within eddies.
- limitation to ocean basins away from shelf boundary currents, thus shelf waters induced anomalies cannot be traced.
- sills shallower than 1000m depth are not sampled (e.g. Denmark Strait, Davis Strait).
- shifting of fronts / representation of fronts in climatologies
- areas that have no “well known” but significant seasonal cycle, thus with only few years of sampling no significant “anomaly mapping” can be performed
- sparse temporal/spatial float data in some regions

Data Used

Argo (JAN 2000 - DEC 2008)

ftp from usgodae/geo/atlantic...
(pacific, indian) (OpenDAP
turned out to be too slow to
use!)

Data interpolated onto depth
levels used, - gaussian
weighting of all data points less
than 10m away. (3m/10m)

Climatology

- SAC-Climatology
(Gouretski and Jancke,
1998)
- Monthly values
- 4-D interpolated on
position and yearday of
each float profile data
point used

Data Used

Argo (JAN 2000 - DEC 2008)

- QC flags = 1 (better than „probably good“)
- POSITION_QC
- PRES_ADJUSTED > PRES
- TEMP_ADJUSTED > TEMP
- PSAL_ADJUSTED > PSAL

COMPARED

Climatology

- SAC-Climatology (Gouretski and Jancke, 1998)
- Monthly values
- 4-D interpolated on position and yearday of each float profile data point used

Data Used

How good is the anomaly data?
Argo – Climatology

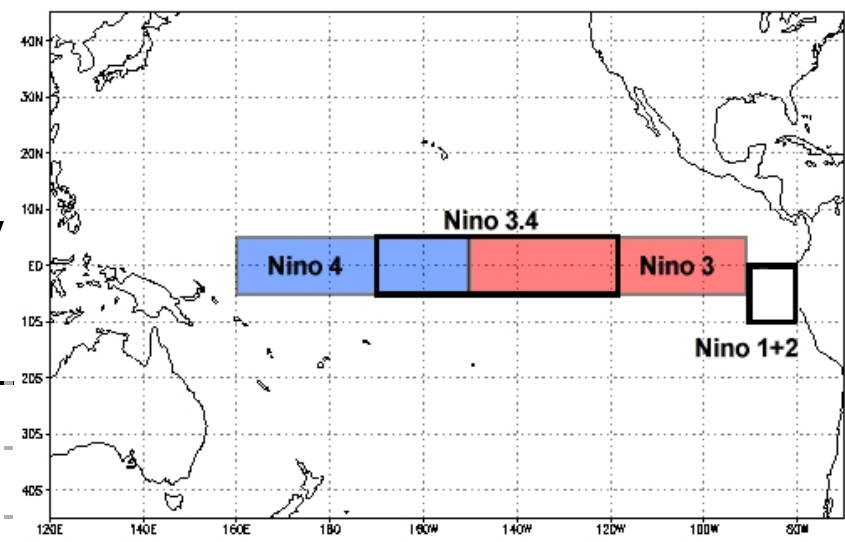

What resolution can be achieved?
What cannot?

Validation of T-anomaly in large areas

How good is the derived anomaly data?

- SST is close to top 20m temperature data.
- SST data is weekly, monthly mean of float data used

El Niño 3

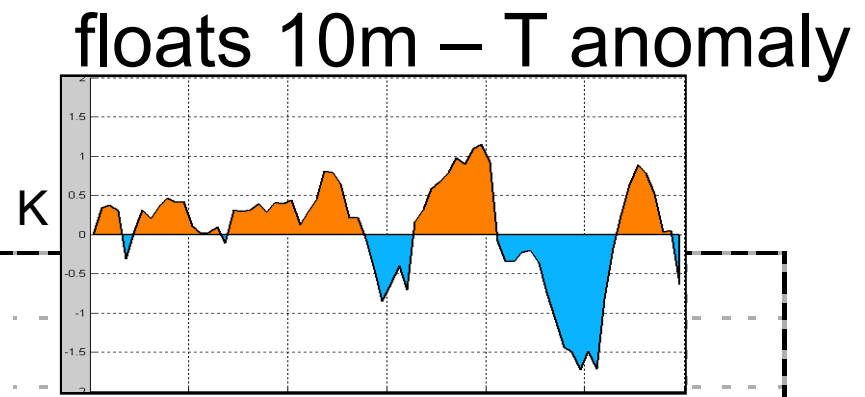

satellite – SST anomaly

Validation of T-anomaly in large areas

How good is the derived anomaly data?

- SST is close to top 20m temperature data.
- SST data is weekly, monthly mean of float data used

Validation of T-anomaly in large areas

How good is the derived anomaly data?

-Large scale SST anomalies
observed by satellite
can be reproduced

floats 10m – T anomaly

4 El Nino 4

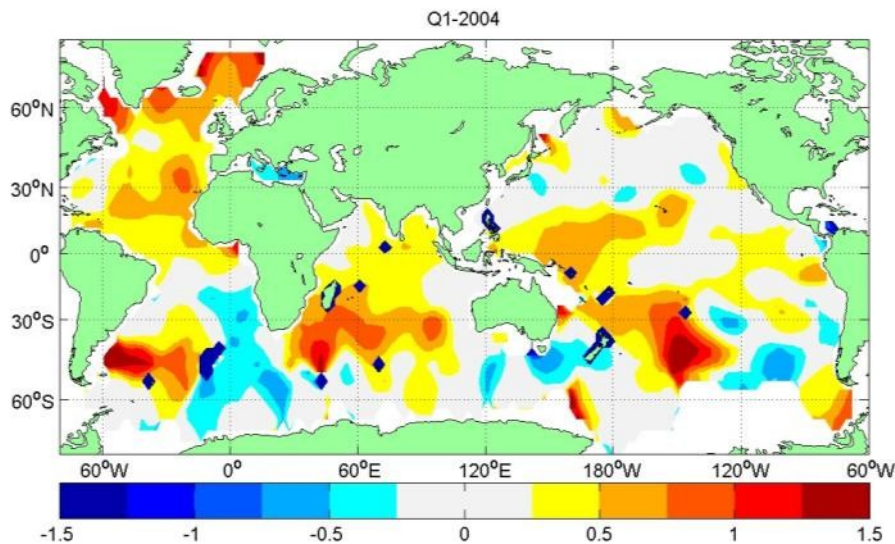

Validation of T-anomaly fields

SURFACE

acceptable quality since 2004 in some areas

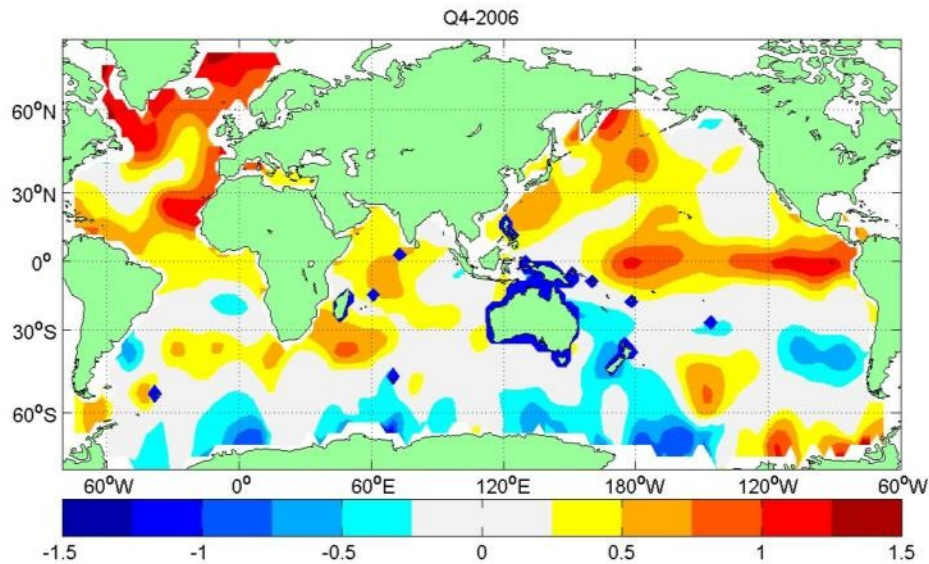

Gaussian weighted $6^\circ \times 6^\circ$ ($10^\circ \times 10^\circ$)

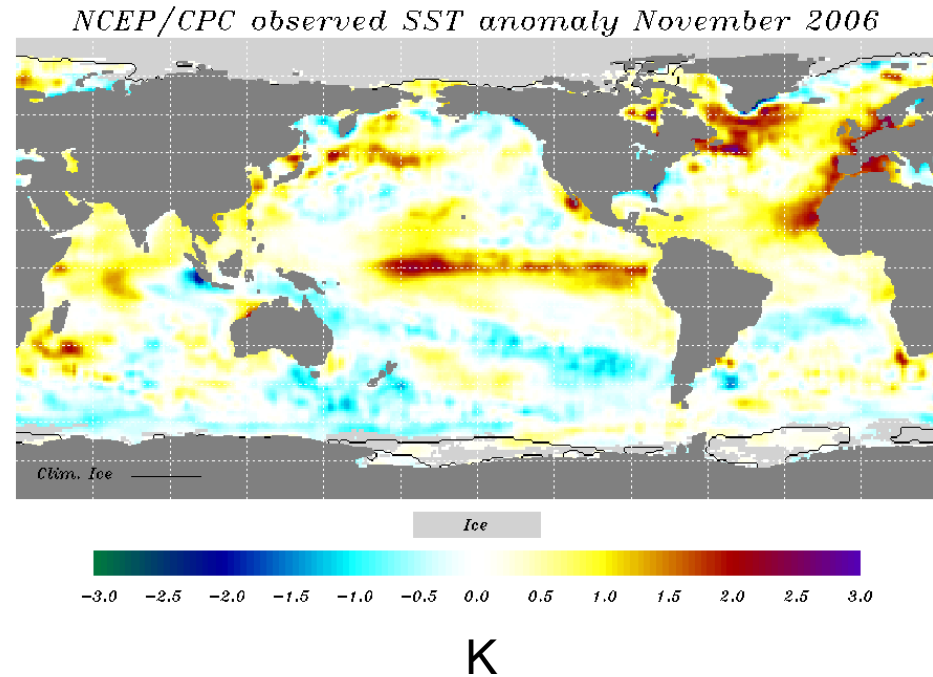

Validation of T-anomaly fields

SURFACE

Good quality since 2006

Gaussian weighted $6^\circ \times 6^\circ$ ($10^\circ \times 10^\circ$)

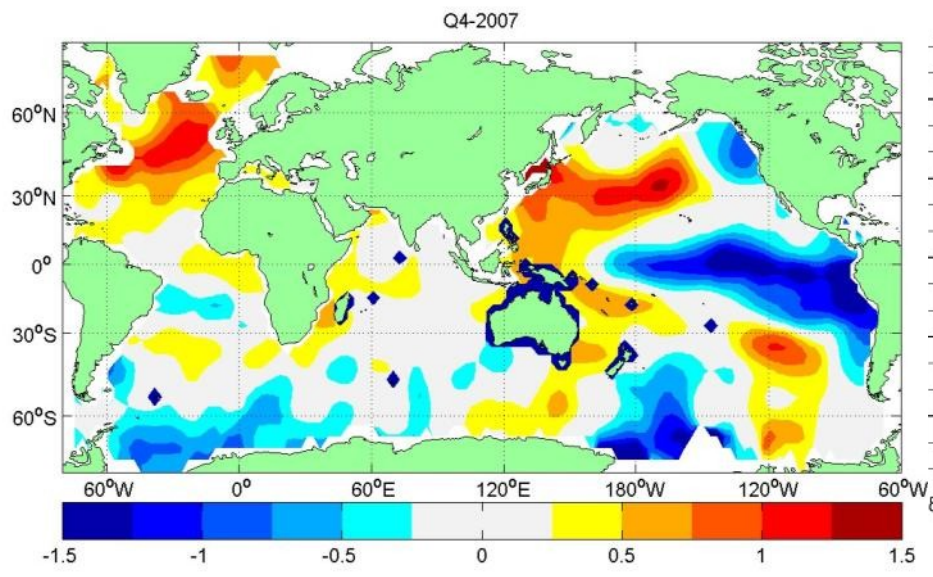

K

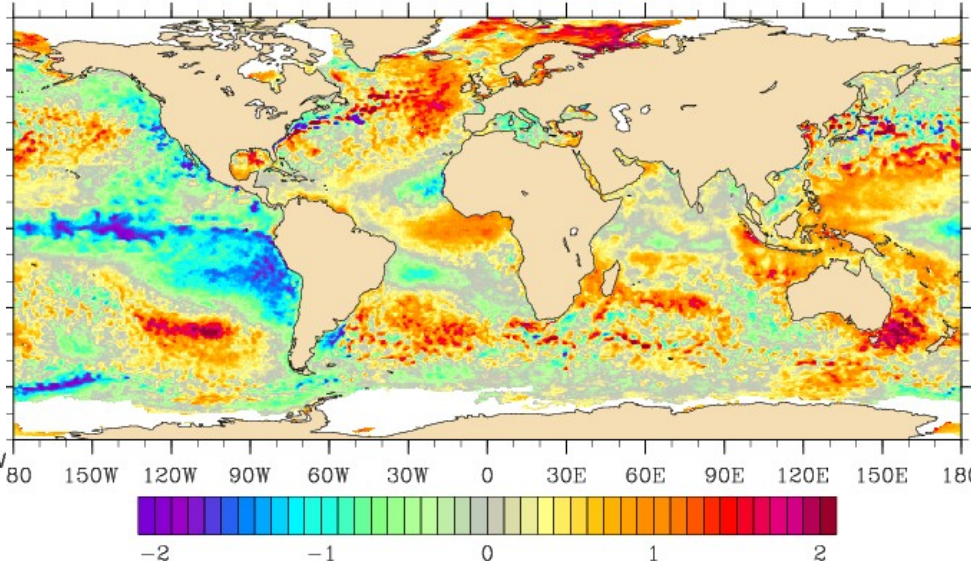

Validation of T-anomaly fields

SURFACE

“smaller” features can be found

ODYSSEEA SST anomaly - 12 2007 MERSEA deg. C

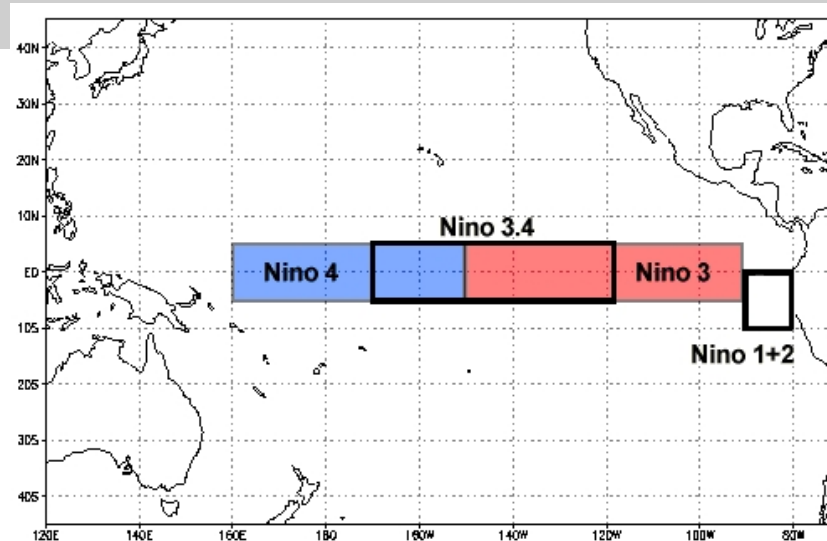

Gaussian weighted $6^\circ \times 6^\circ$ ($10^\circ \times 10^\circ$)

K

El Nino areas - „salinity anomalies“

temperature anomaly [K]
salinity anomaly x4 [psu]

El Nino areas - „salinity anomalies“

temperature anomaly [K]
salinity anomaly x4 [psu]

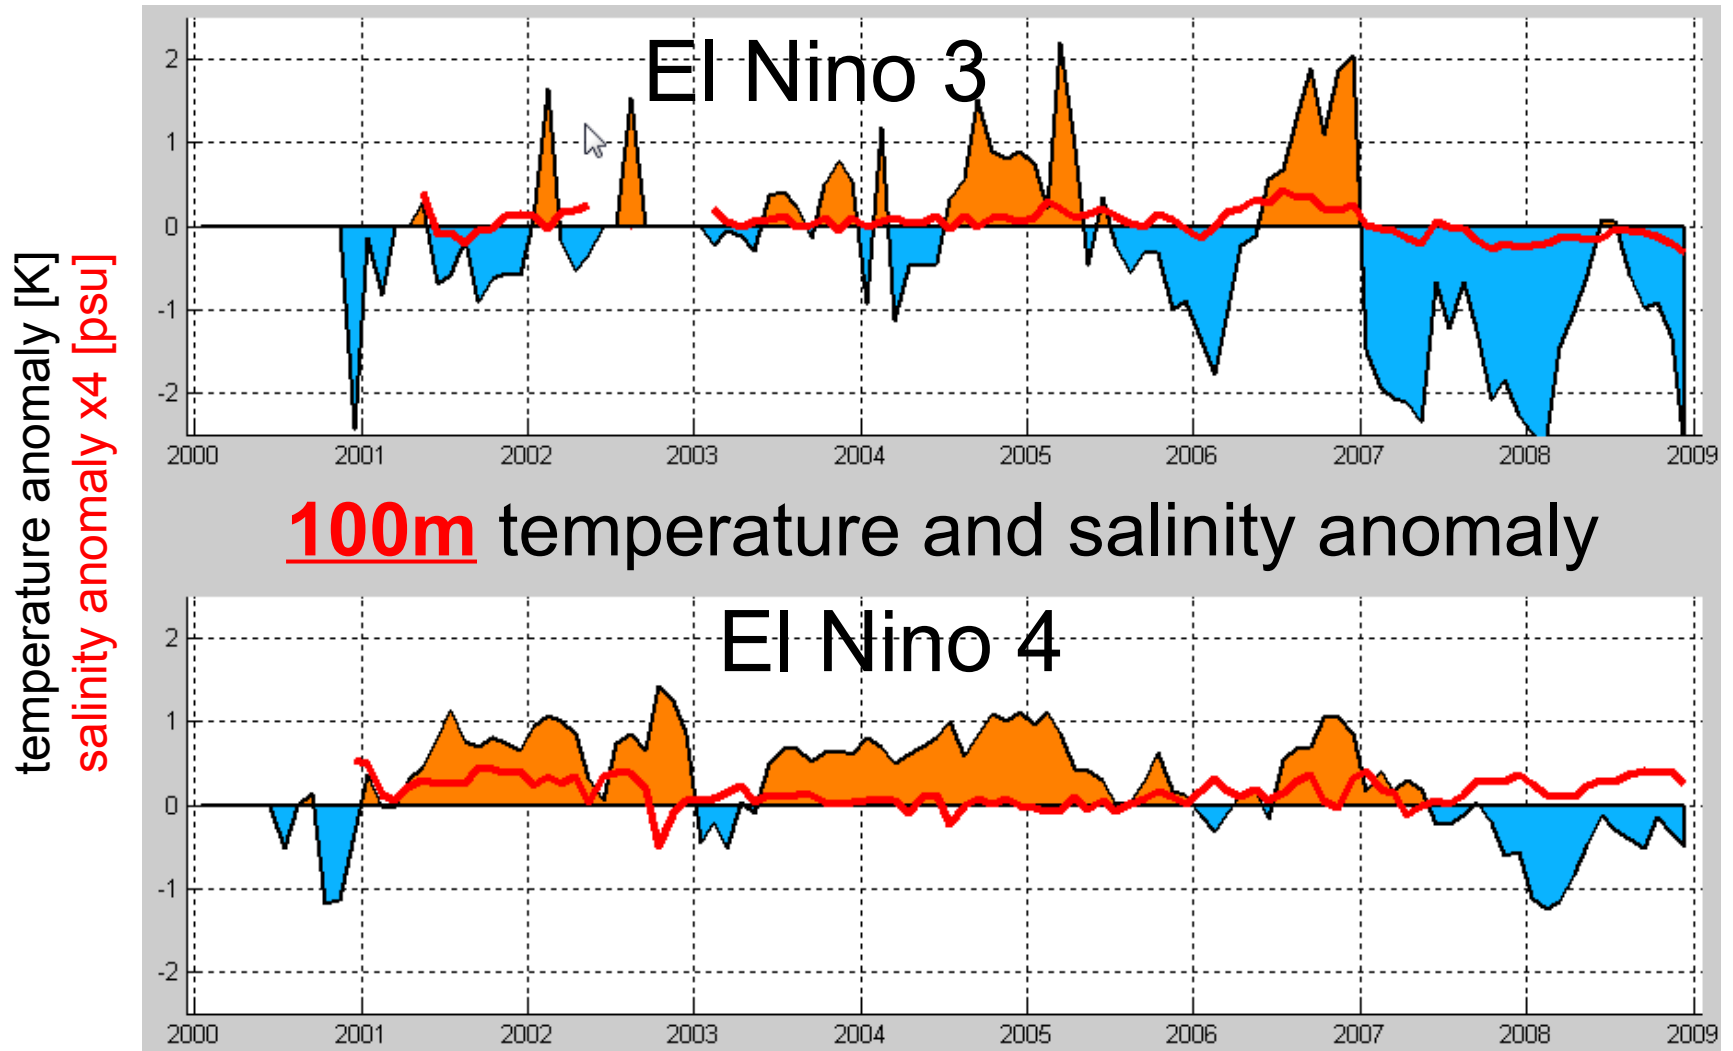

El Nino areas - „salinity anomalies“

- El Nino 3: after 2003 ΔT - ΔS correlation = 0.59 – after 2005: correlation = **0.73**
- El Nino 4: after 2003 ΔT - ΔS correlation = **-0.69** – after 2005: correlation = **-0.82**

What is the reason for this? How deep does it reach?

El Nino areas - „salinity anomalies“

El Nino areas - „salinity anomalies“

- El Nino 3: after 2003 ΔT - ΔS correlation = 0.59 – after 2005: correlation = **0.73**
- El Nino 4: after 2003 ΔT - ΔS correlation = **-0.69** – after 2005: correlation = **-0.82**

At and below 100m the salinity anomaly is reduced by a factor of four.

Salinity anomaly is mainly found at surface.

El Nino areas - „salinity anomalies“

December - February La Niña Conditions

Probably: Walker Circulation Feedbacks

Equatorial Pacific anomalies

- Near surface anomaly
- Likely an atmospheric feedback loop along the equator
(La Nina precipitation patterns)

Small Outlook

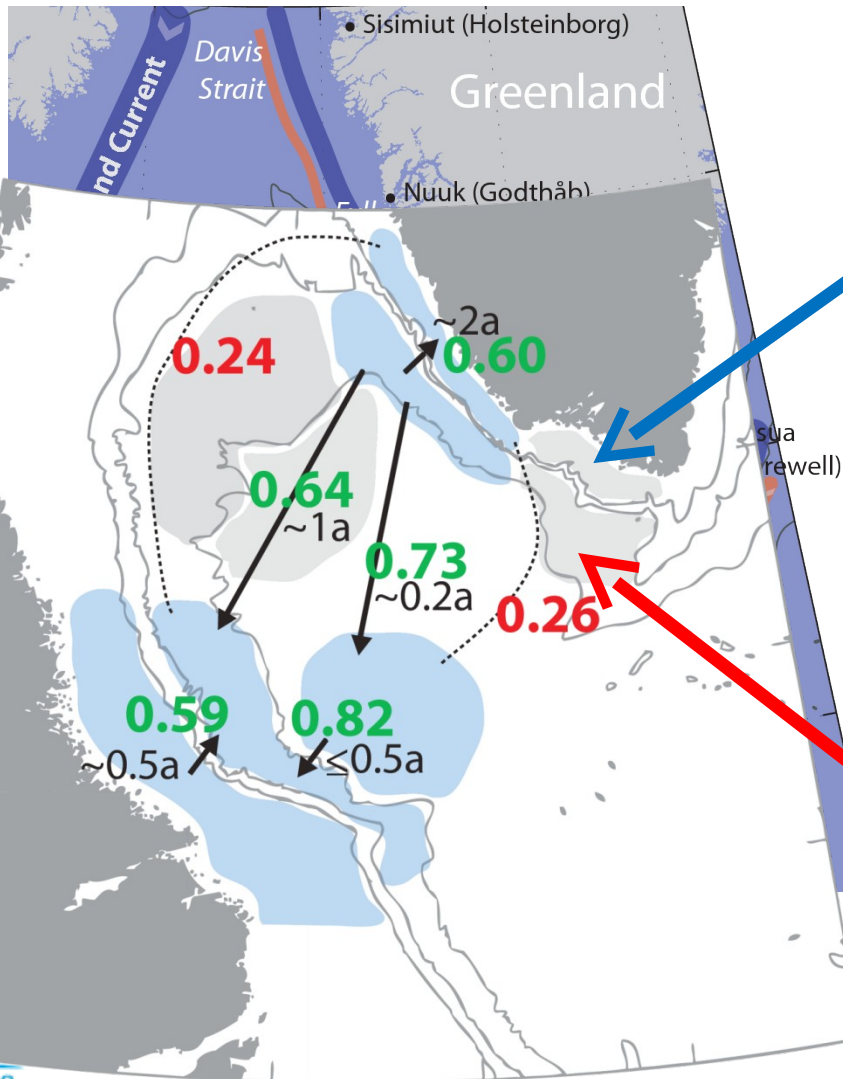

- Impacts of salinity anomaly are verified.
- Fate of anomaly isopycnal traced

Labrador Salinity anomalies

Dickson et al. (1988)/ Dietrich et al. (1980)

Labrador Salinity anomalies

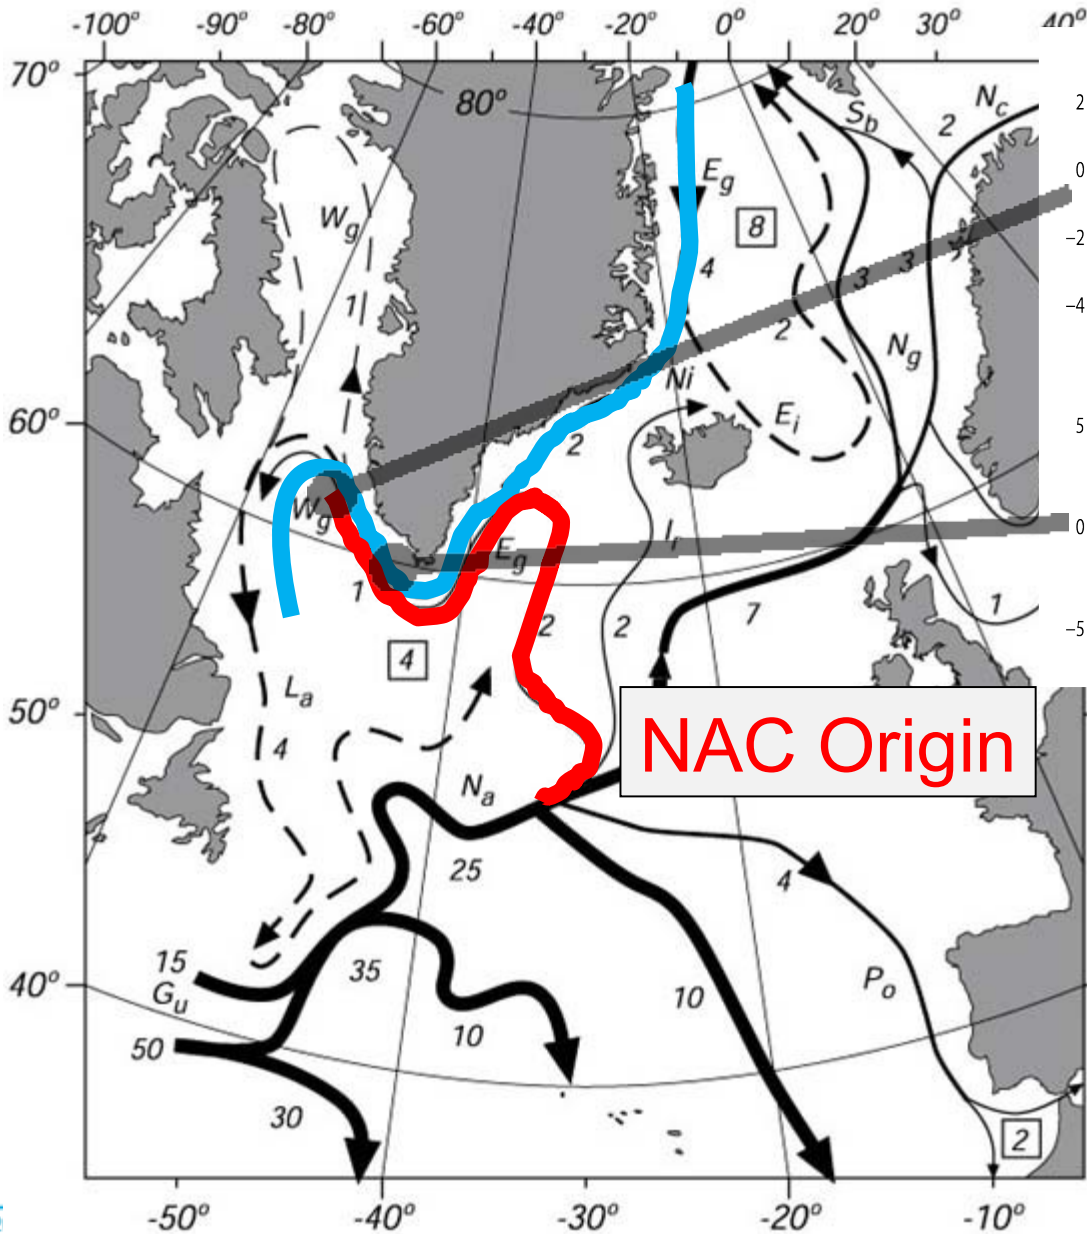

West Greenland Current

Seasonal Cycles

Irminger Current

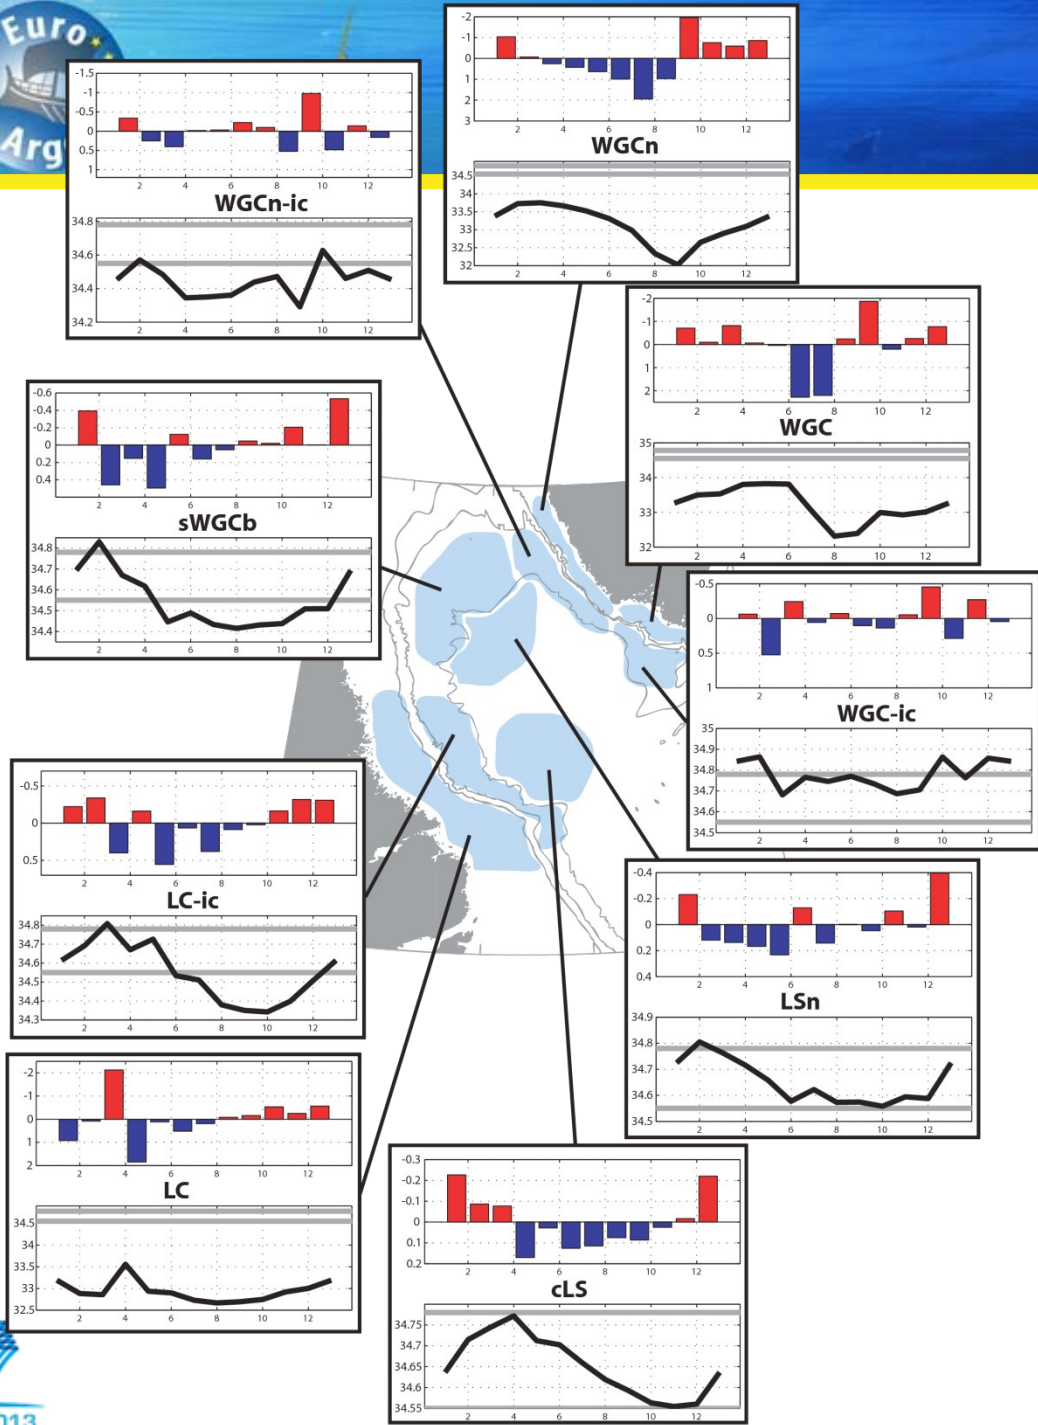

NAC Origin

Anomalies at source traceable?

Labrador Sea Salinity Cycles

Very different seasonal cycles within a „small“ area

100m salinity anomaly NAtl.

300m salinity anomaly NAtl.

North Atlantic Anomalies

Cannot be tracked straight forward.

Has there been any surface anomaly propagating on the last years?

Central Labrador Sea

Labrador Sea close to Labrador Current

Increase possibilities by
-f/H interpolation NOT 5x5° or similar

Improvements

Was there just NO anomaly in those years?

Increase possibilities by

- isopycnal not isobaric analysis
- f/H interpolation NOT $5 \times 5^\circ$ or similar
- streamfunction weighted interpolation
(leads to an extreme shortage of floats in some areas)
- better climatology needed, regional covariance fields?

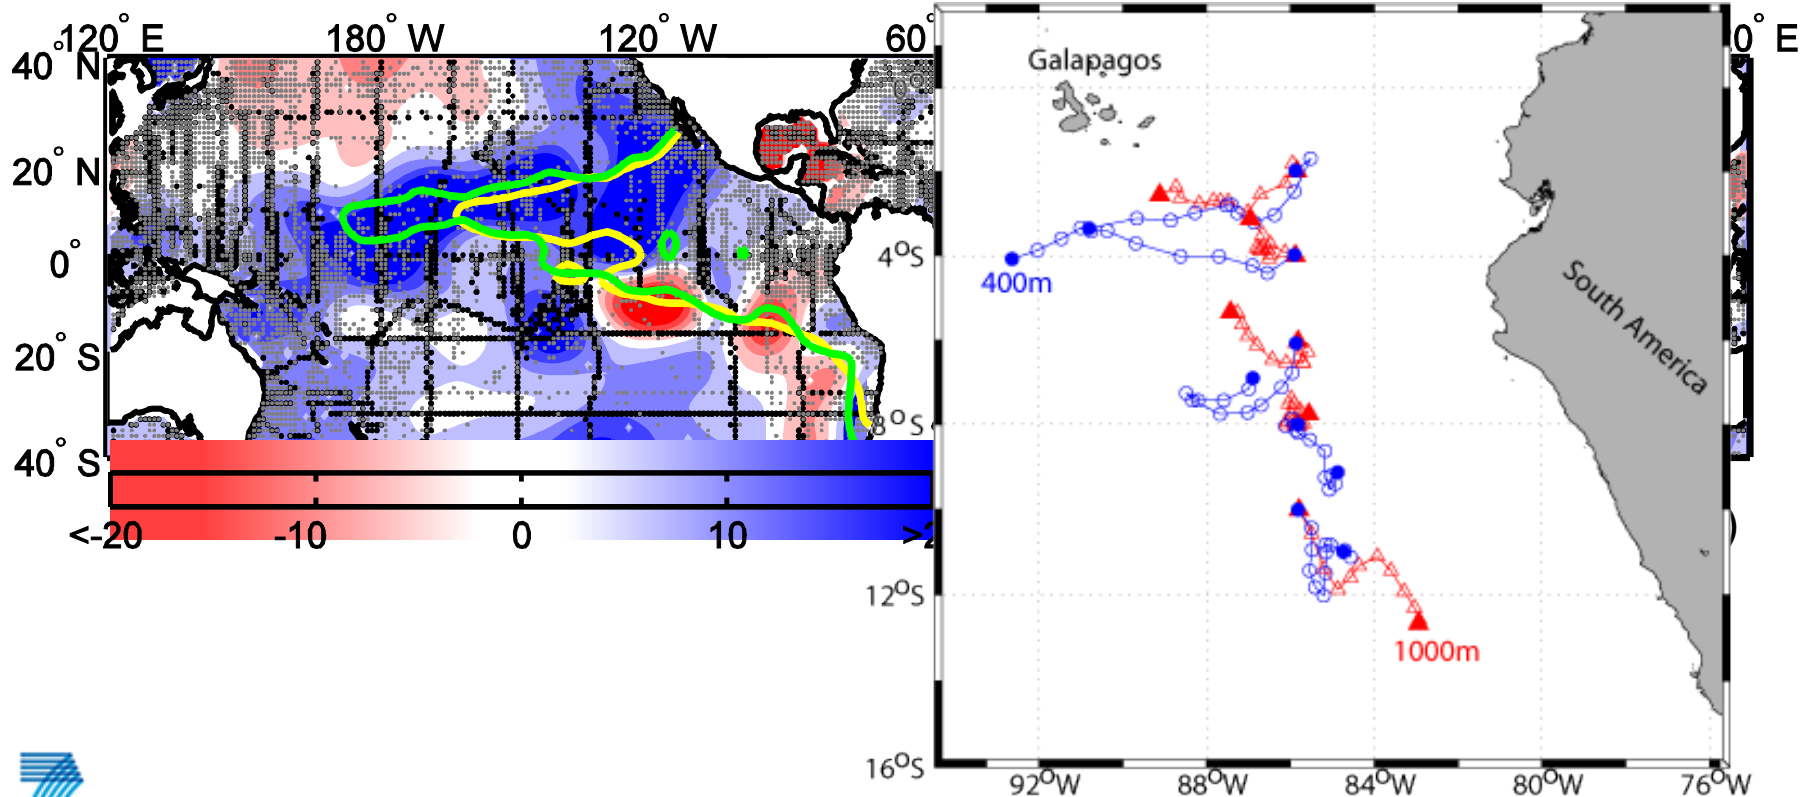

Float deployment not 3×3 but related to ocean variability. (Fronts, Seasonal Cycle, Convection, Streamfunction)

Future Work

200m Dissolved Oxygen Change 1960-1975 to 1990-2007

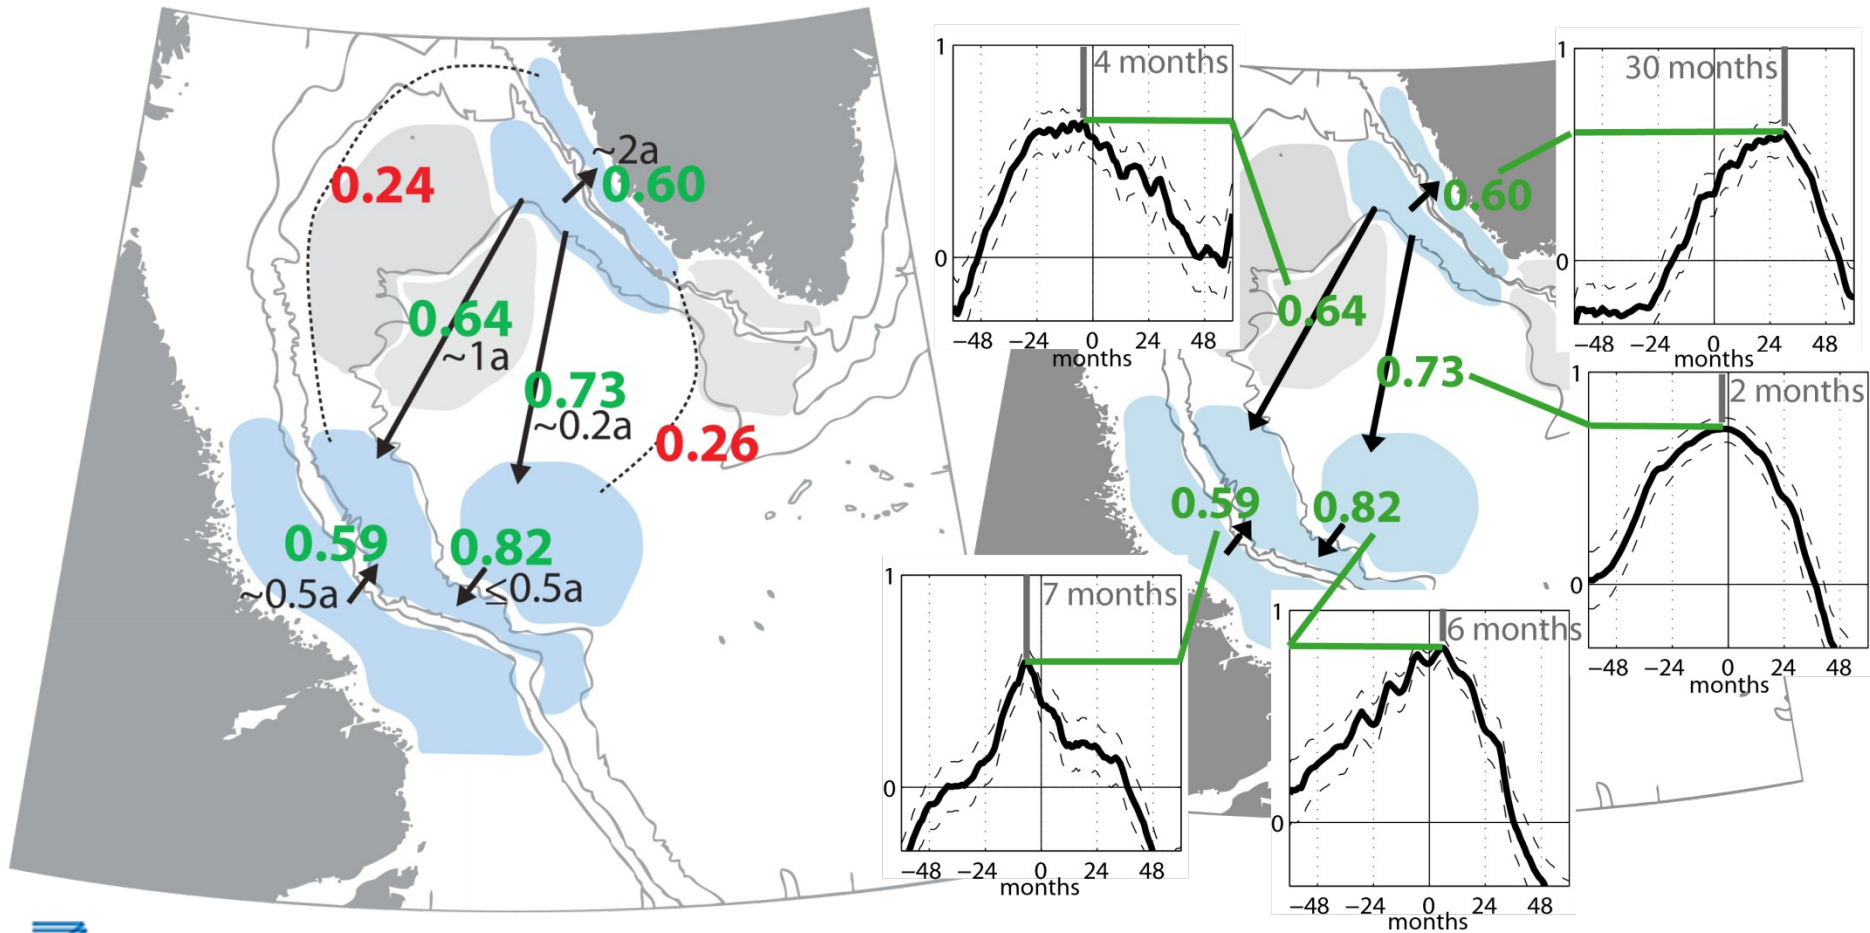

10 APEX floats with Aanderaa oxygen optodes
400m and 1000m drift depth

Labrador Salinity anomalies

Labrador Salinity anomalies
