# Idealized experiments: AMOC

Dunstone and Smith, 2010

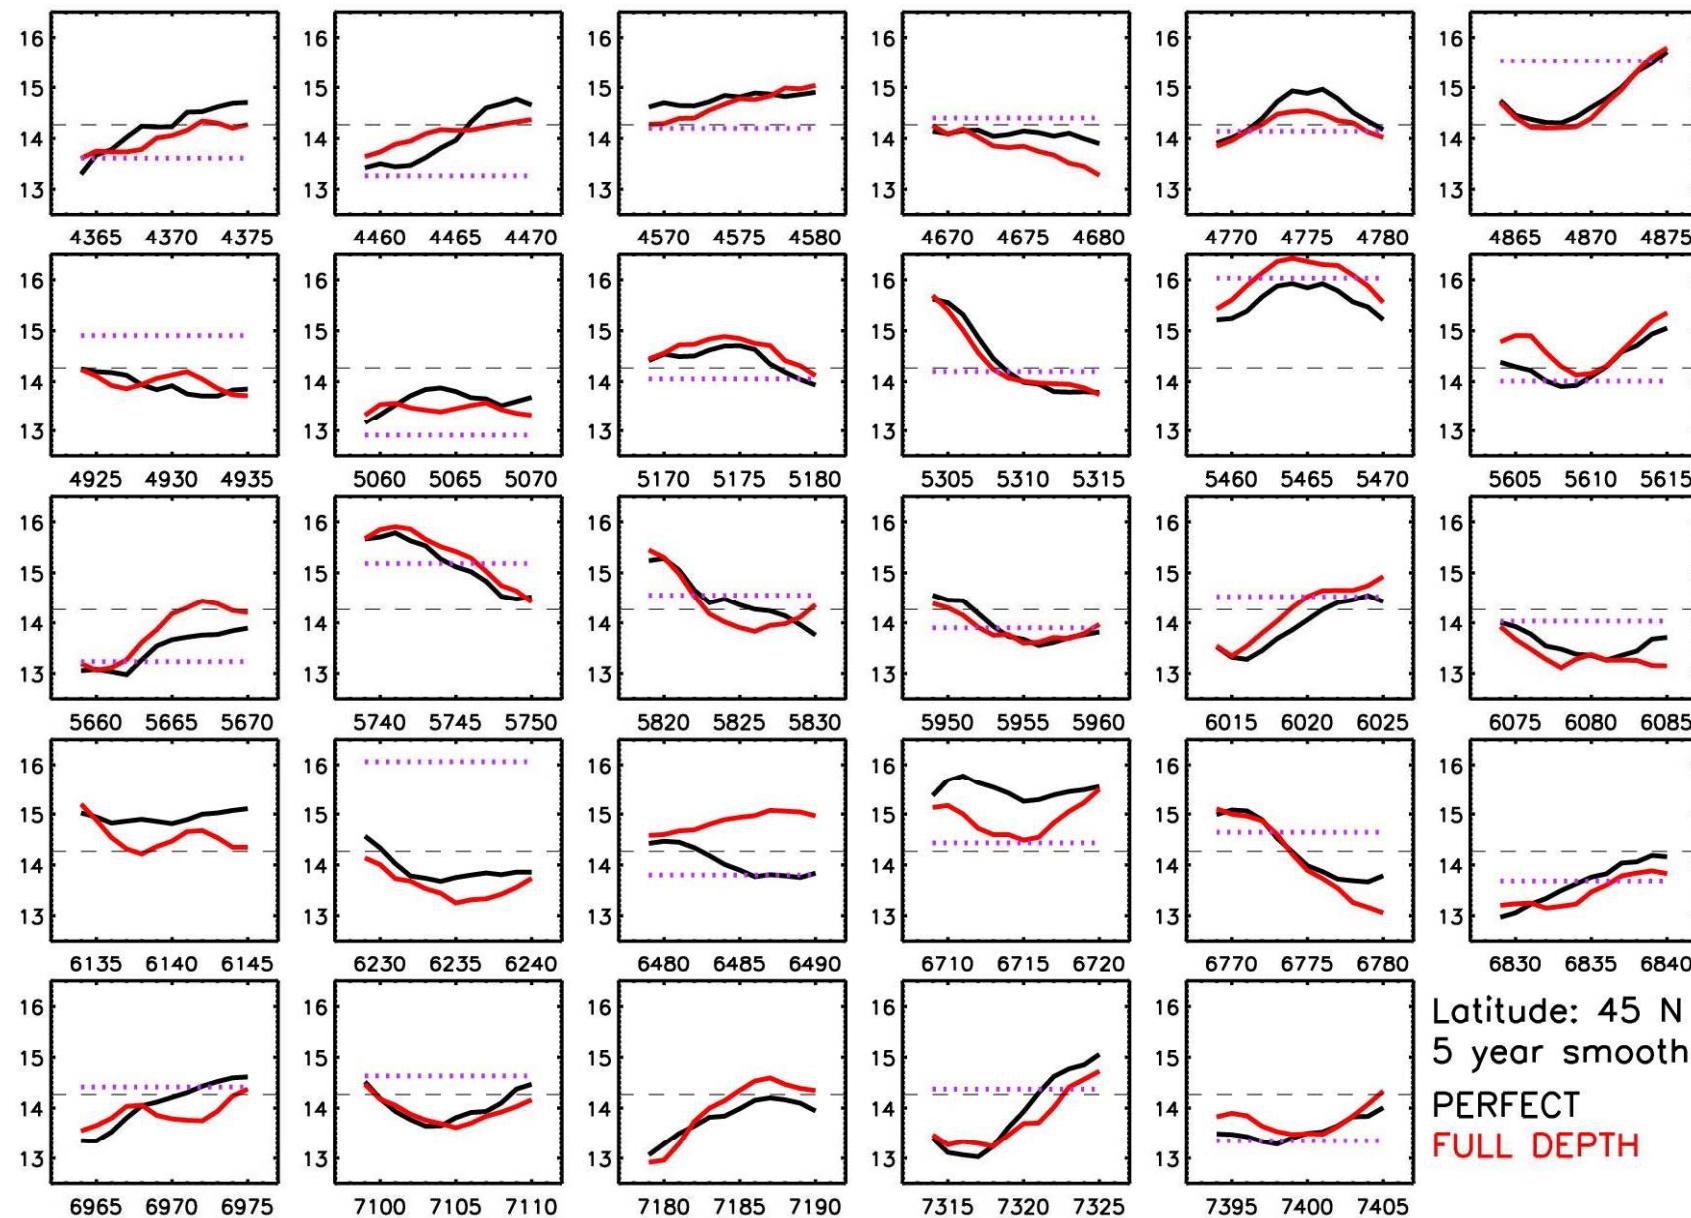

# New set of experiments underway...

- Subsample ocean data at 2007/08 Argo locations and then at pre-Argo (1990's) locations. Use co-variances from another climate model (HadGEM) to infill data. Predict HadCM3 original evolution.
- **TEST:**
  - realistic density and locations of observations
  - imperfect model covariances
  - impact of initial conditions on forecast skill
- 29 start dates are planned, with at least four different ensembles:
  - ✓• A **Perfect** member ensemble
  - ✓• A **Full Depth** ensemble – monthly T & S everywhere
  - A **sub-sampled 2008** ensemble (EN3 profile locations)
  - A **sub-sampled 1998** ensemble (EN3 profile locations)
- Each start date consists of a 5 member ensemble created by a small random SST perturbation and is run for 16 years.

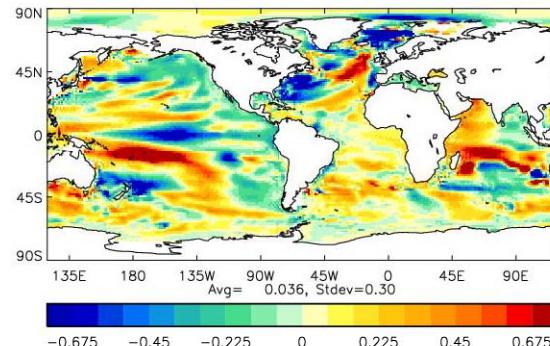

# MOC predictions from the 29 start dates:

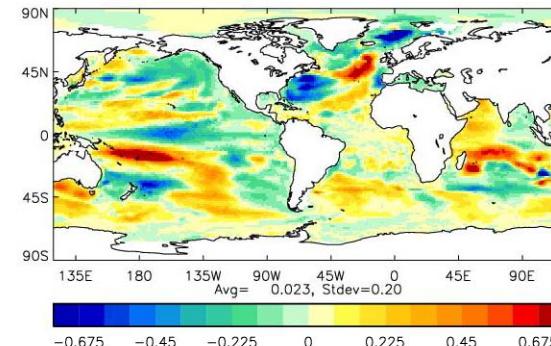

# Ocean analysis

- Gaussian white noise is added to the pseudo observations, picked from real observation locations, then spatially complete fields of anomalies are generated using imperfect covariances.
- These fields are then assimilated into the model for one year

**Pre-Argo**

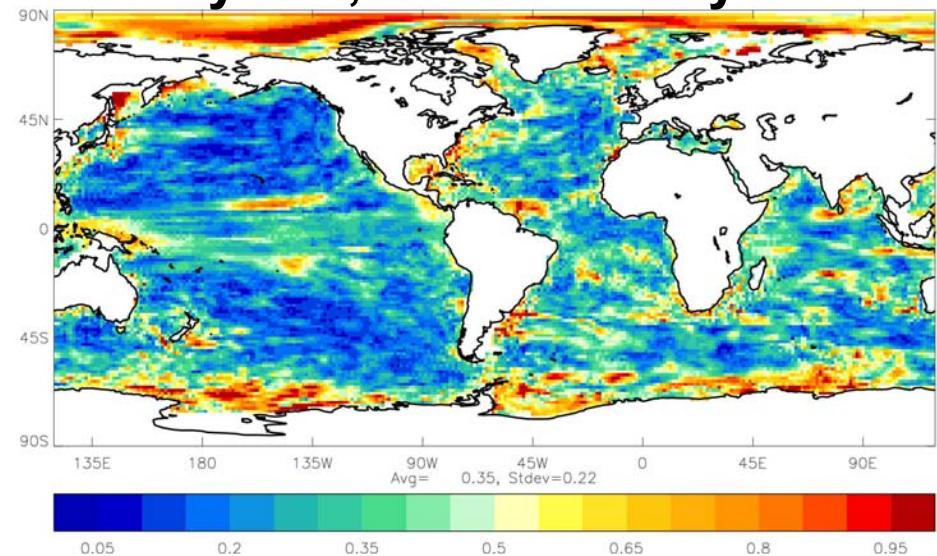

**Argo**

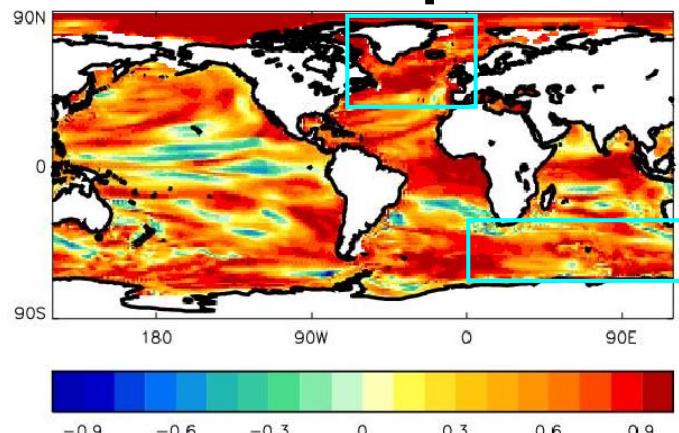

# Assimilation errors and forecast skill: 2008 obs

As expected, some of the largest errors occur in the western boundary currents. However, also in the Nordic Seas (a main sinking region in HadCM3) and the Southern Ocean.

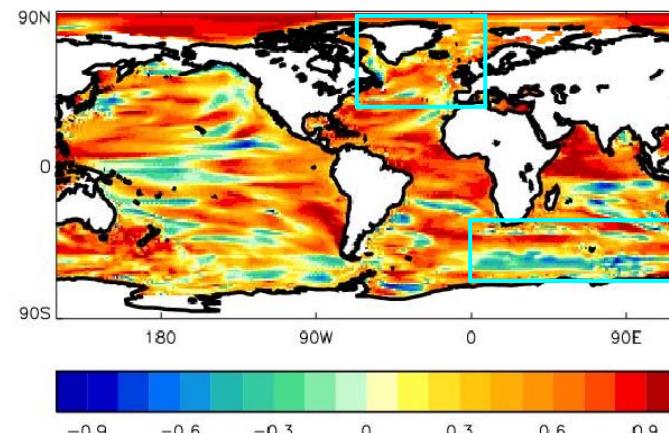

**Mean absolute error of top 360m temperature from the 7 assimilation years, normalised by  $\sigma$ :**

# Summary

- Idealized prediction experiments are potentially a powerful tool for assessing the observing array
  - Preliminary results highlight the northern north Atlantic
  - More skill overall with Argo obs, but room for improvement!
- Multi-model ensemble shows signal of AMOC at 45°N that is consistent with related observations
  - Also skilful predictions out to about 5 years ahead
- Some skill for predicting hurricane frequency (but not perfect!).
  - Low frequency variability appears to be partly externally forced

Hadley Centre

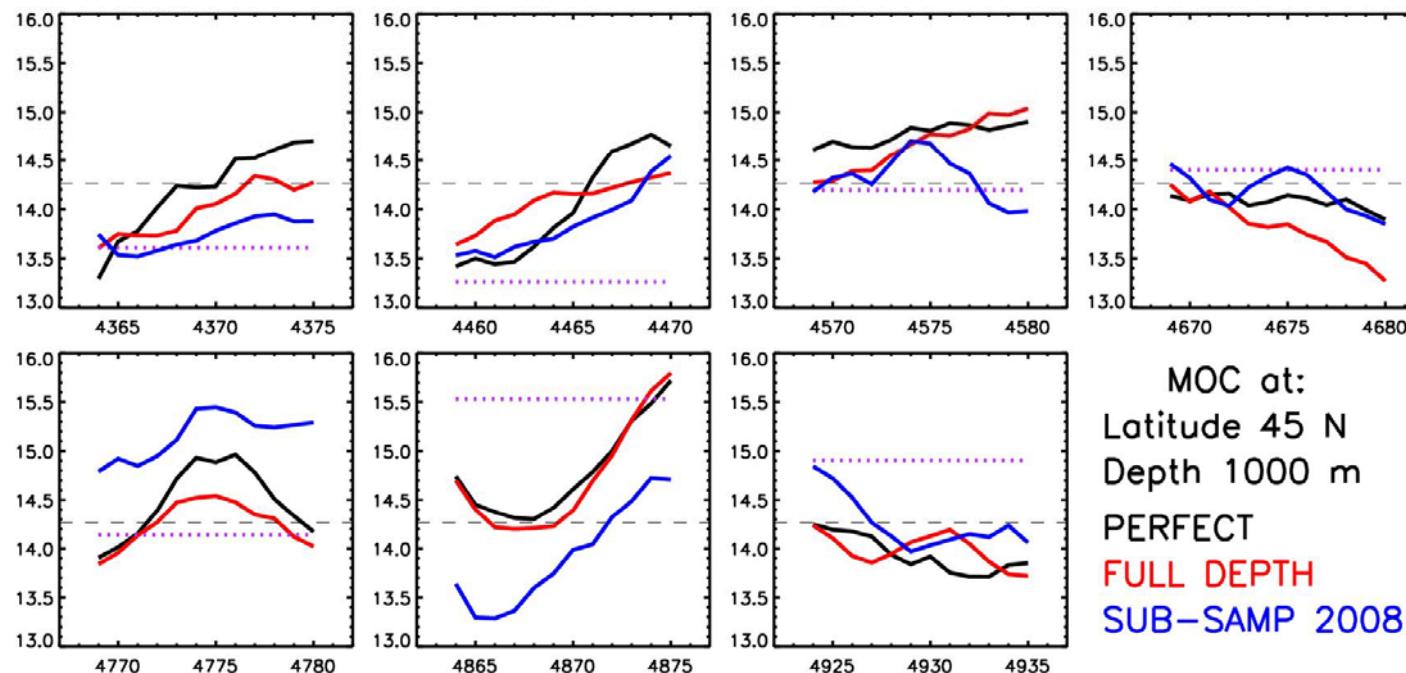

Any questions?

# 15 year predictions of MOC variability

(FIVE YEAR SMOOTHED)

- Sub-sampled 2008 obs generally show correct MOC variability however biases appear to be present.
