The North Icelandic Jet and its contribution to the Denmark Strait overflow water in a high-resolution ocean model

**Carlo Corsaro, Univ. Catania (IT)
Andreas Sterl, KNMI (NL)**

Origin of DSOW

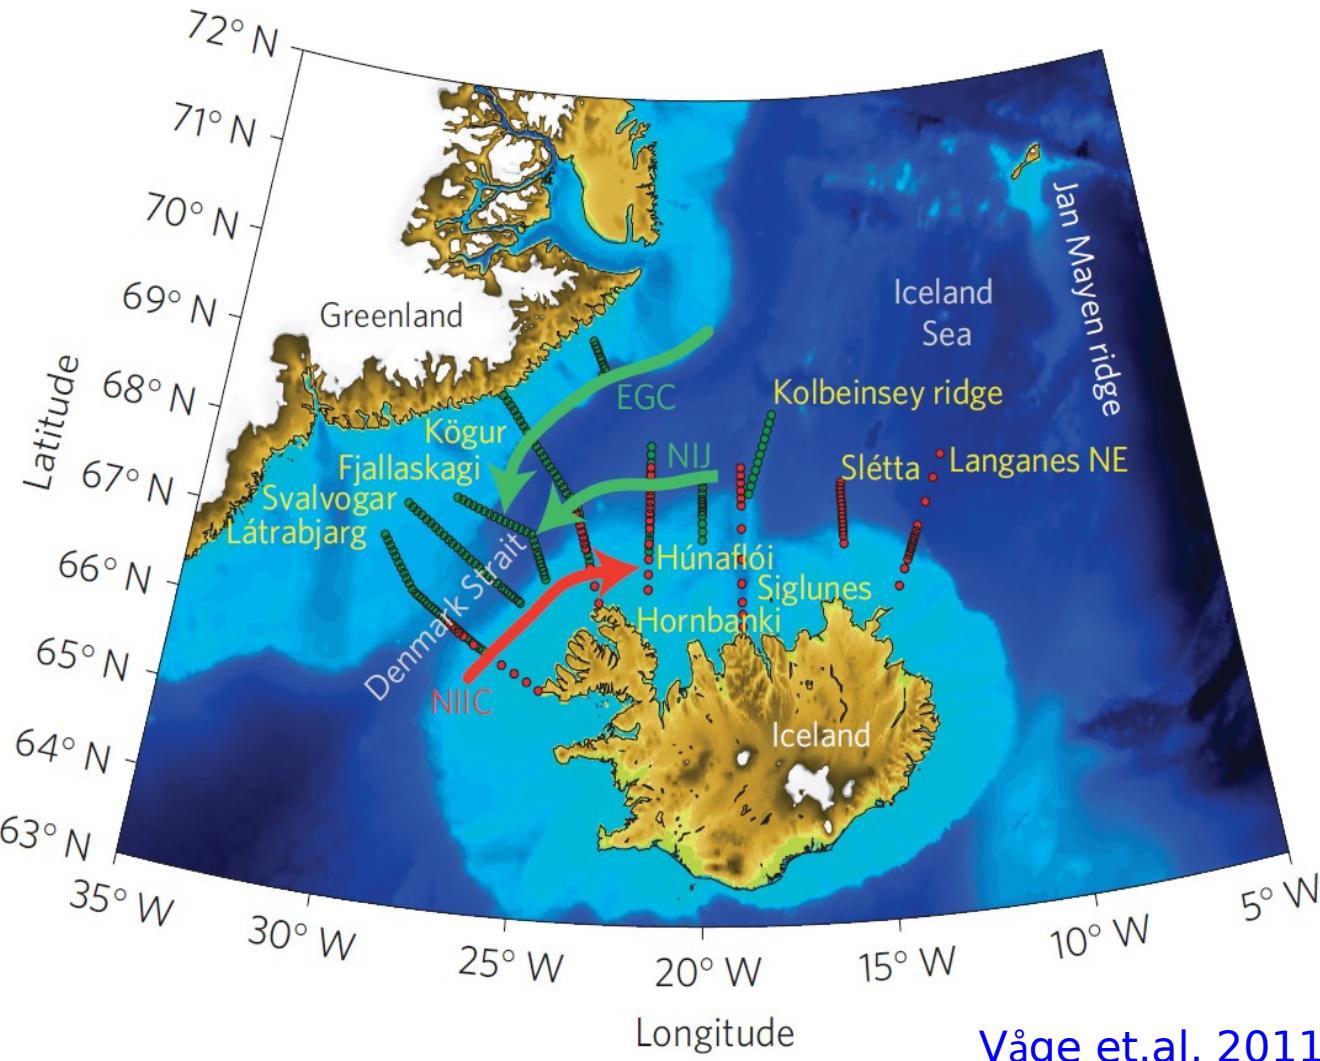

1. open-ocean convection in Nordic Seas => overflow

2. via EGC; derived from boundary current

Våge et.al, (2011):
large and densest part
from NIJ

Mixing (no mass transport) in interior Nordic Seas => NIJ

Sinking (mass transport): NIIC => NIJ

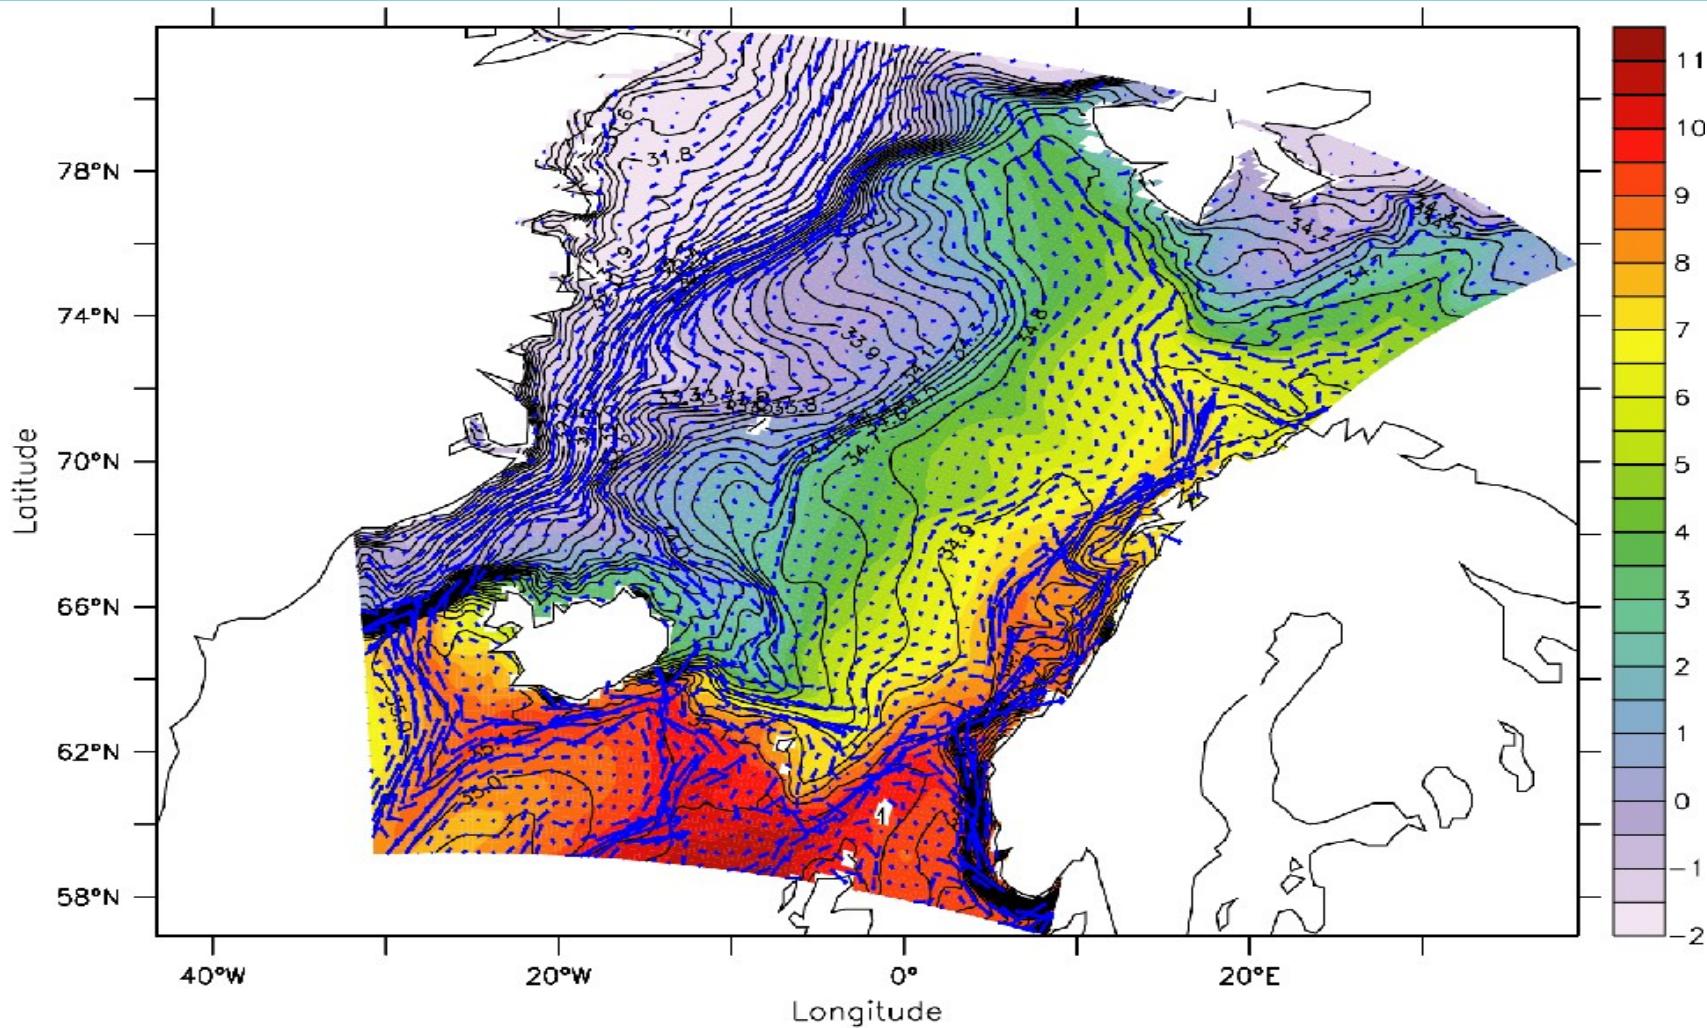

Våge et.al, 2011

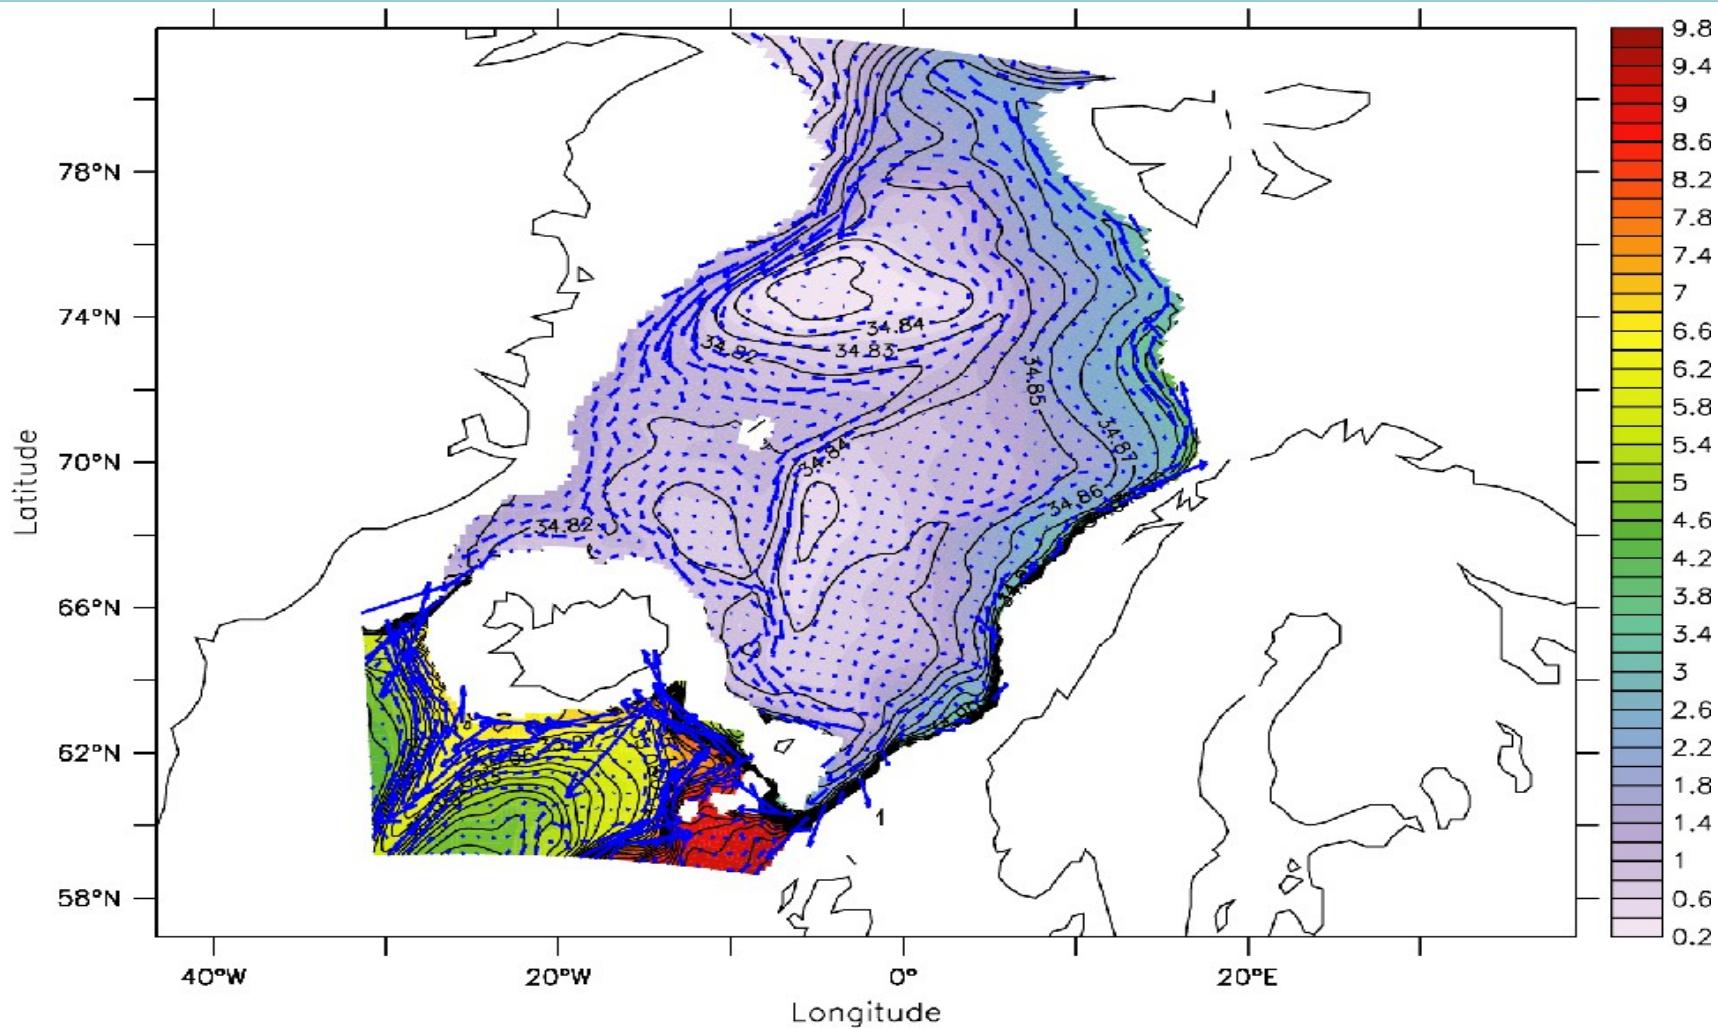

The model

- NEMO in ORCA025 config (0.25 deg, but higher in Nordic Seas)
- 46 layers
- Stand-alone
- Sub-surface restoring
- 45 years (ERA-40 period)
- Here: last 25 years
- DFS3 forcing (derived from ERA-40)
- Output: 5-day averages
- Here: monthly-means

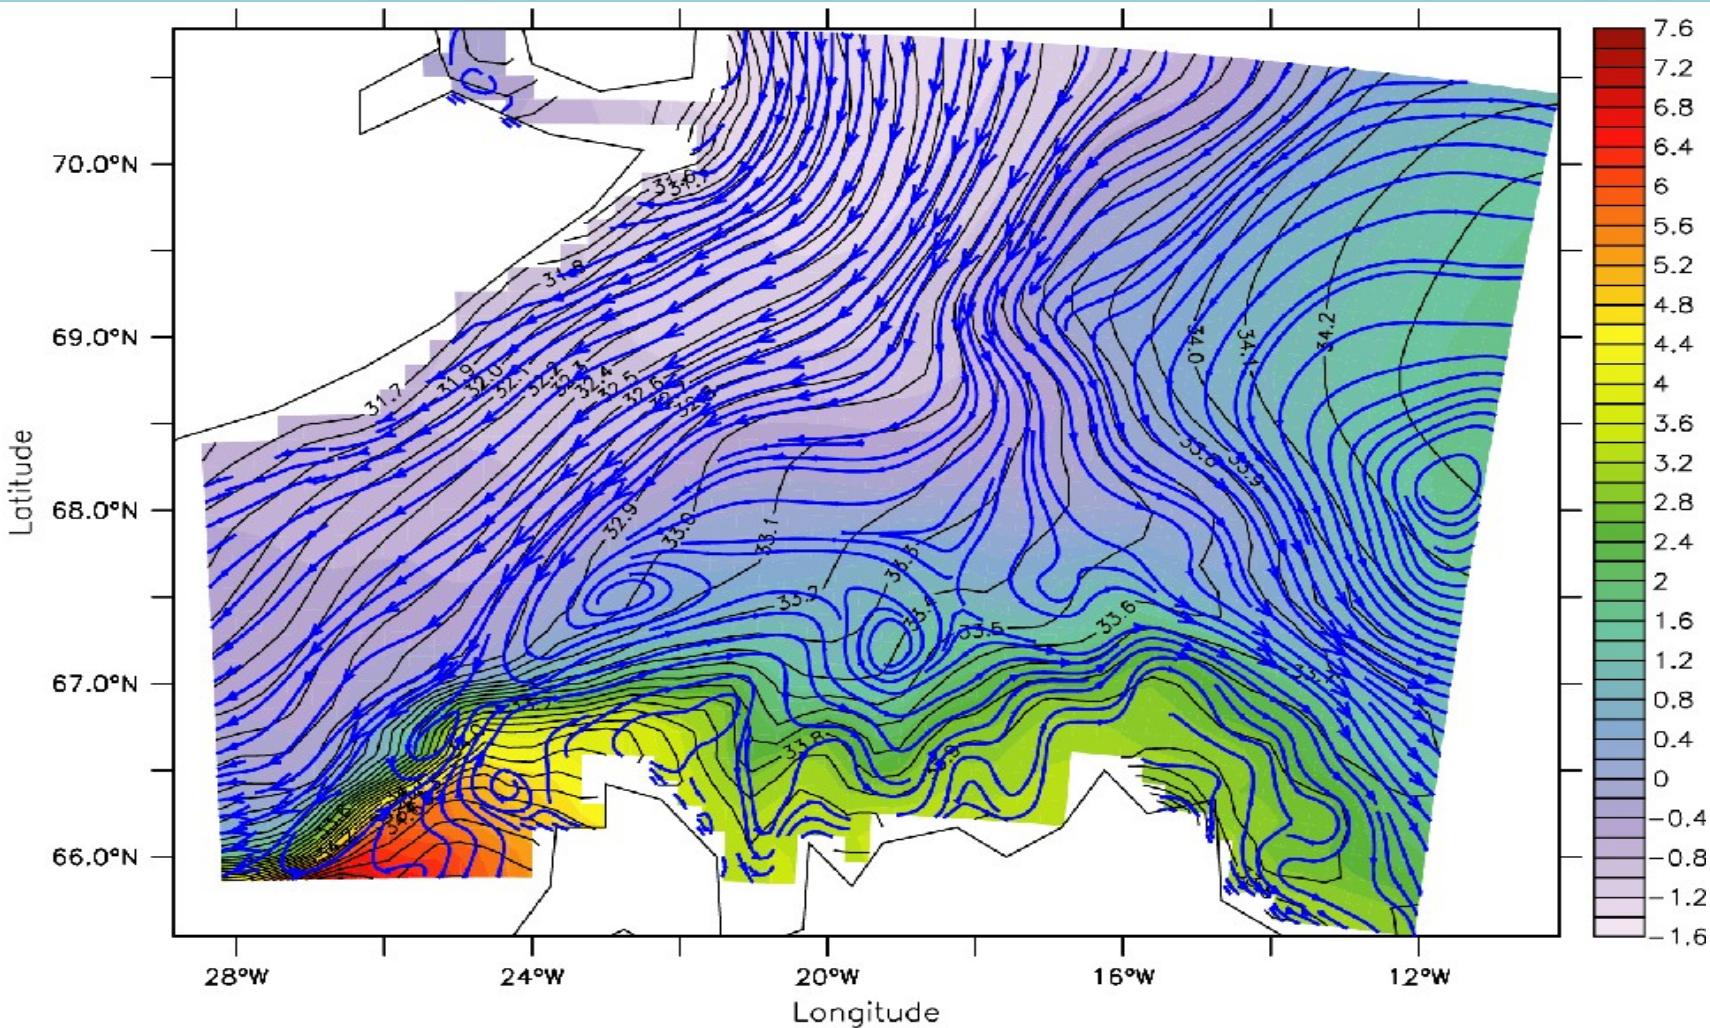

T + S + vel. at $z=9.454049$

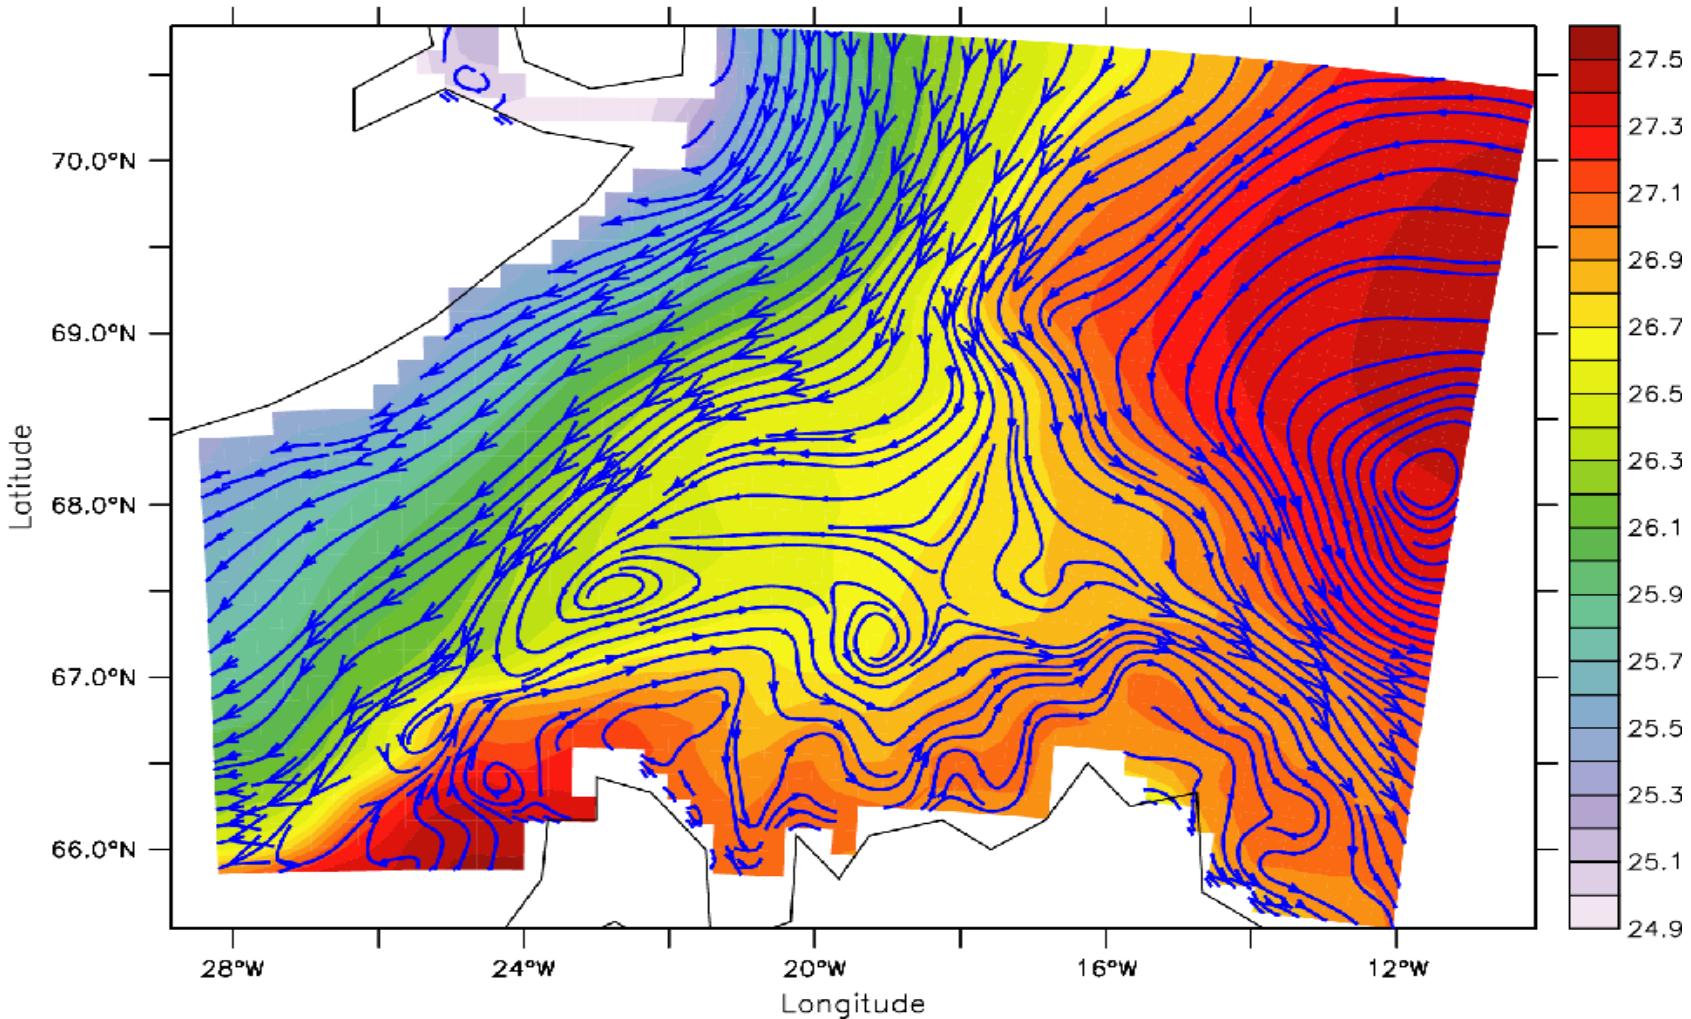

A. Sterl; Argo Workshop, Southampton
20.06.2013

T + S + vel. at $z=534.0197$

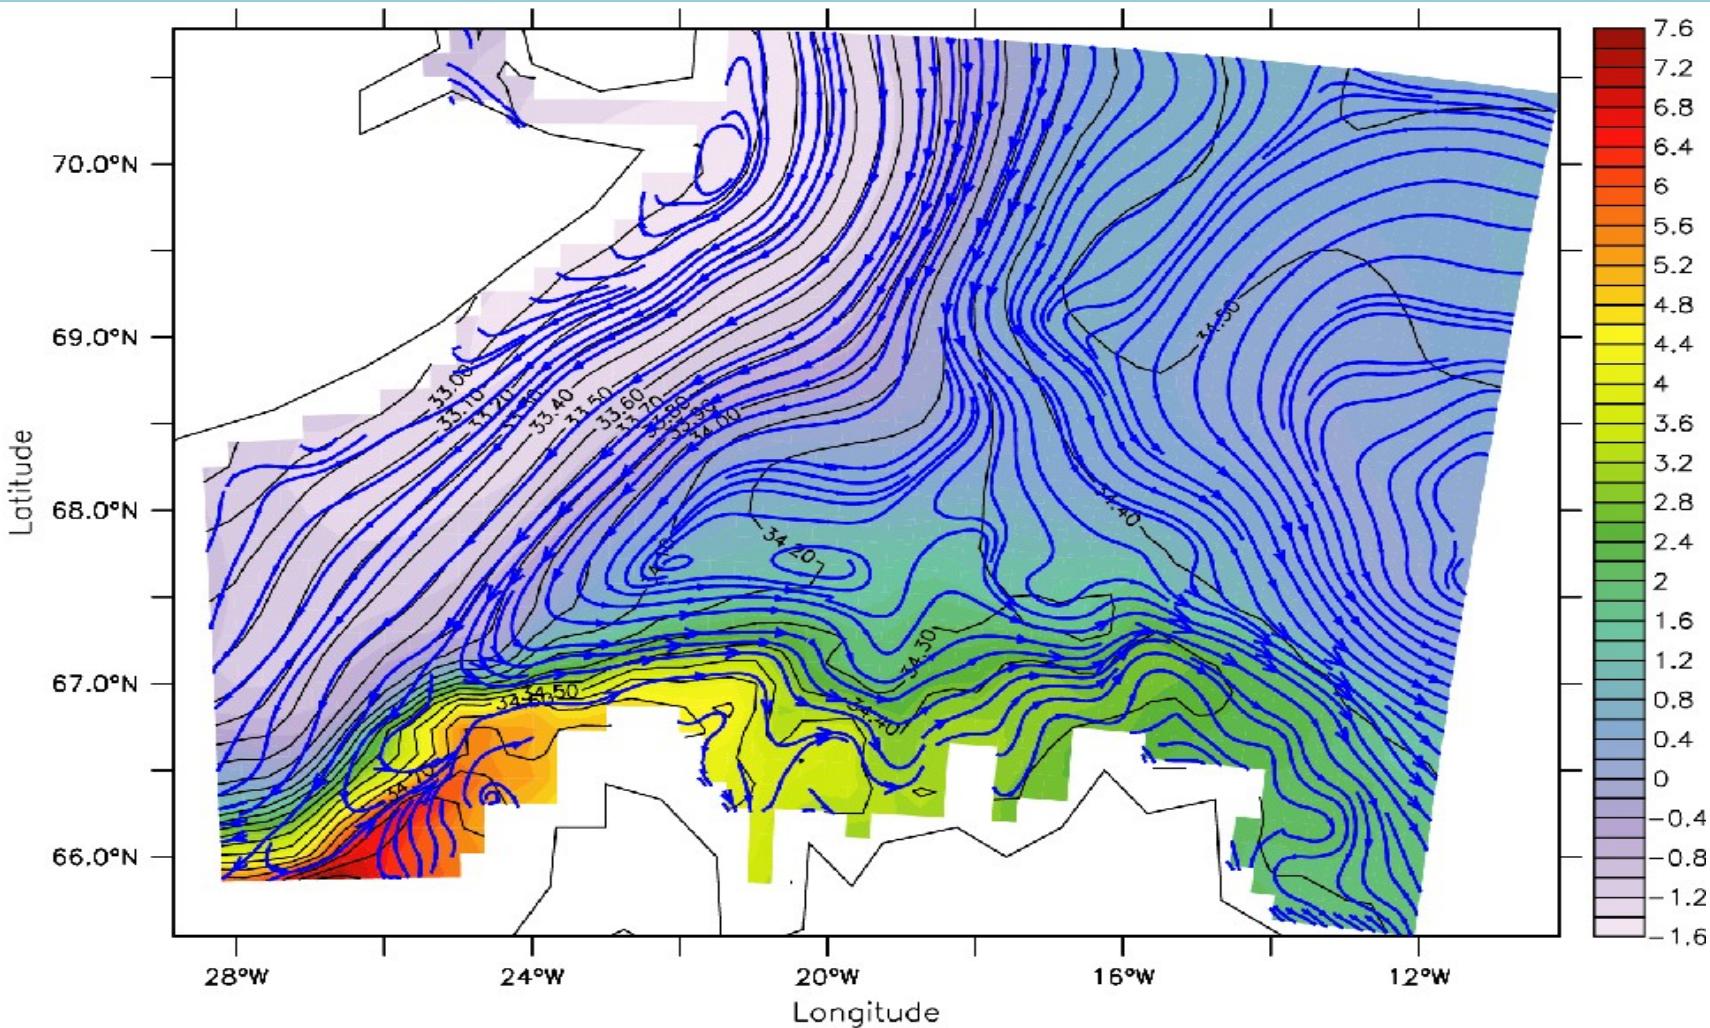

A. Sterl; Argo Workshop, Southampton
20.06.2013

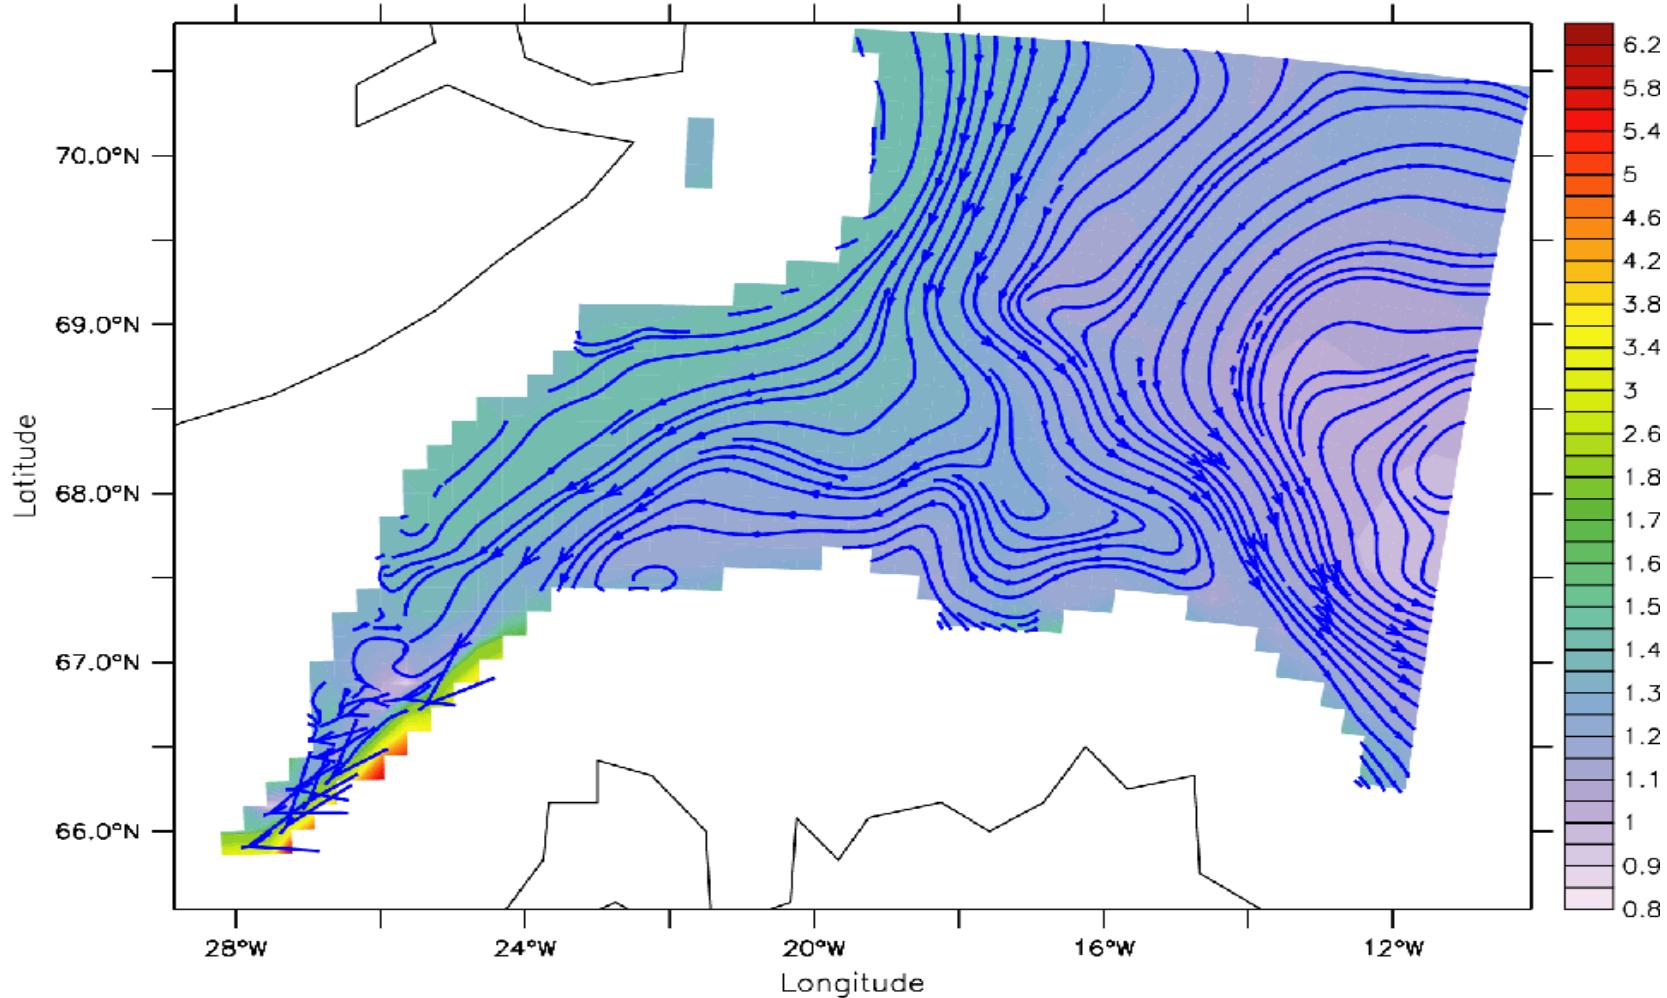

Density (σ_0) at $z=9.454049$

A. Sterl; Argo Workshop, Southampton
20.06.2013

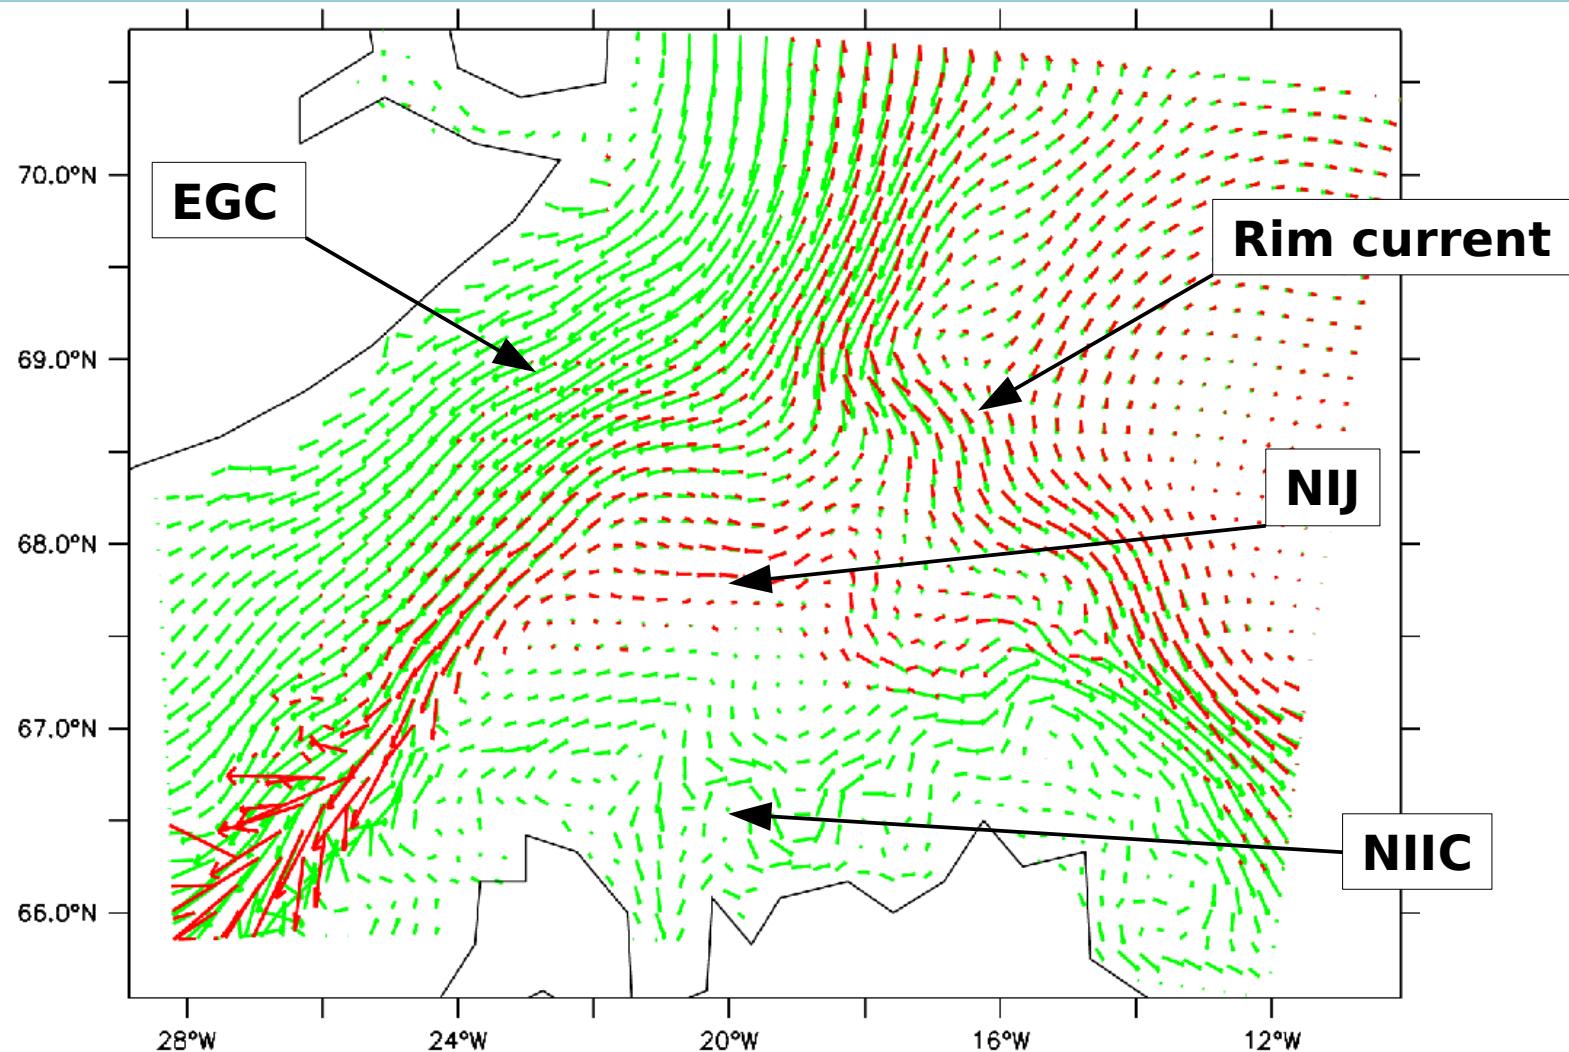

$T + S + \text{vel.}$ at $z=93.59412$

A. Sterl; Argo Workshop, Southampton
20.06.2013

$T + \text{vel. at } z=452 \text{ m}$
— flow arrow scale $6.25\text{E-}02$

A. Sterl; Argo Workshop, Southampton
20.06.2013

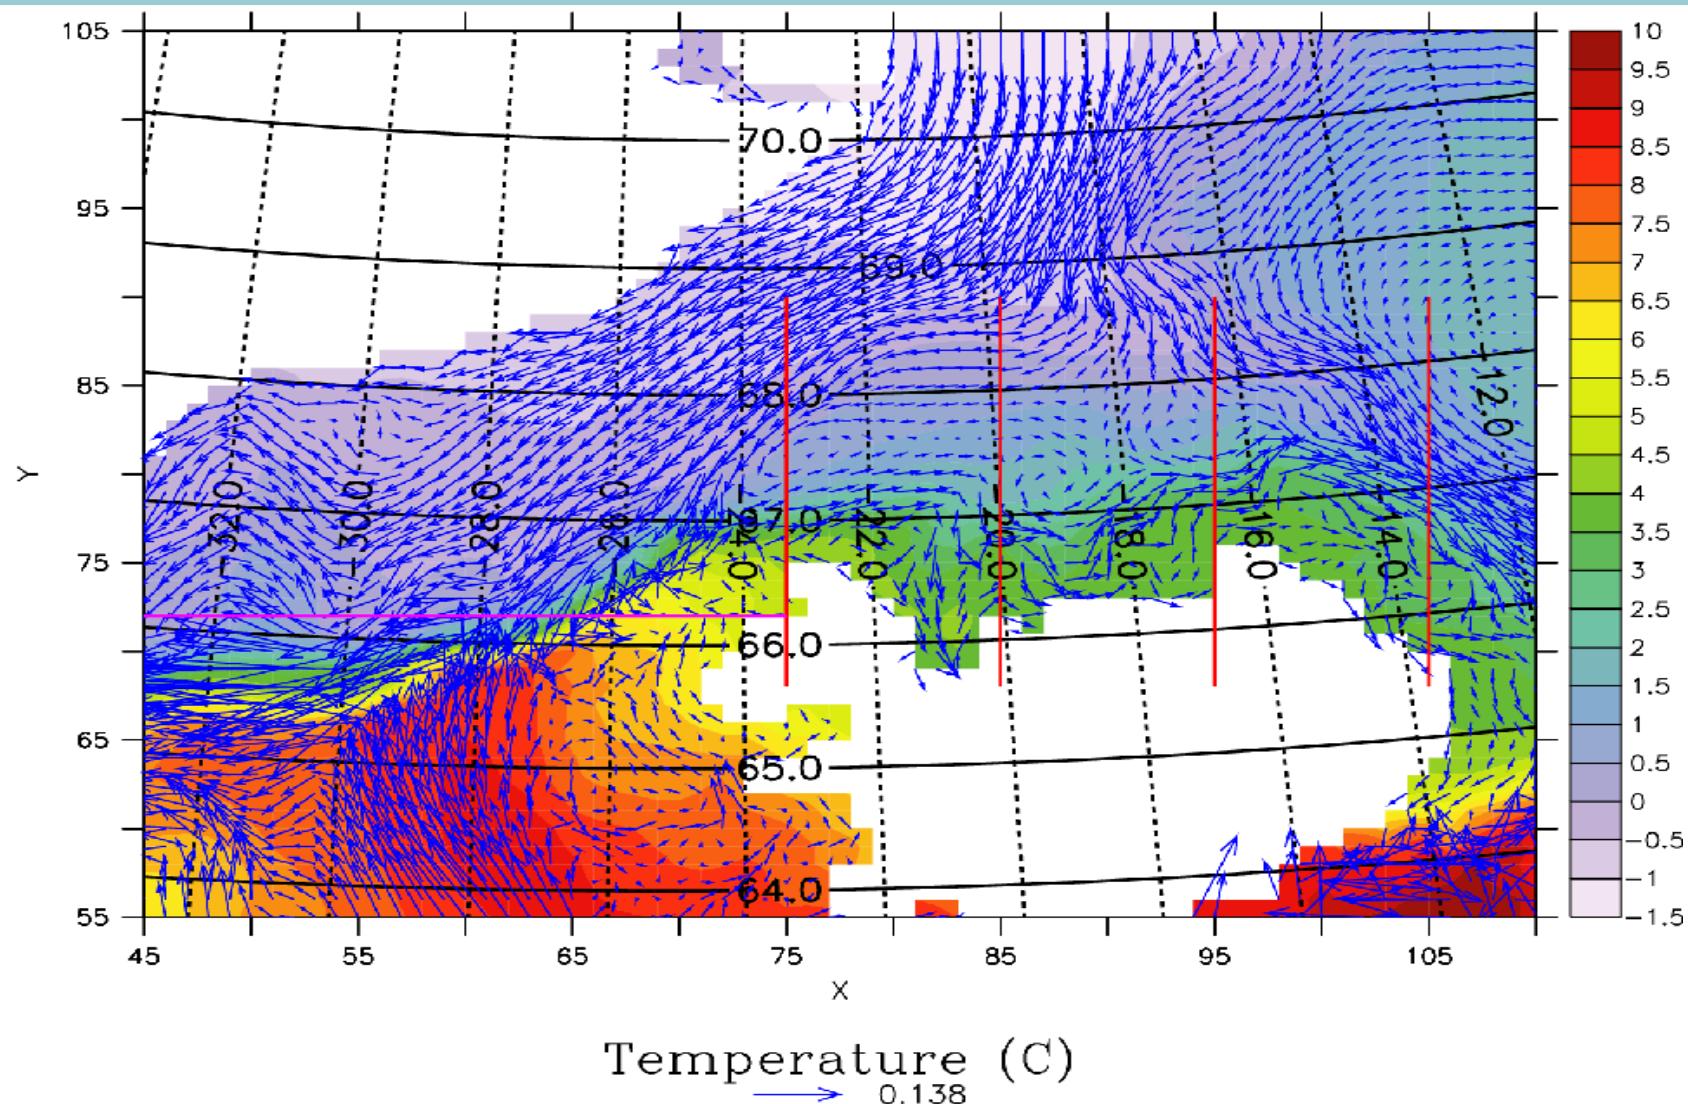

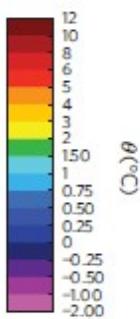

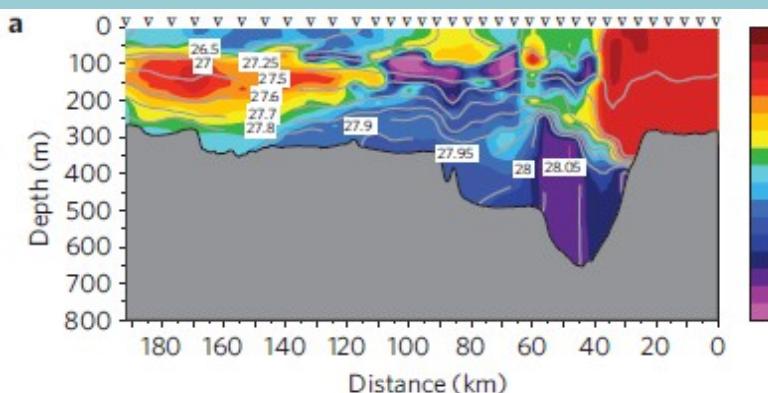

Transports

	observation	model
NIIC	0.75 / 1.5	1.2 – 1.35
NIJ (20°W)	1.5 ± 0.2	1.2 ± 0.3
DSOW	2.9 – 3.7	3.2 ± 0.7

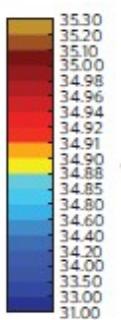

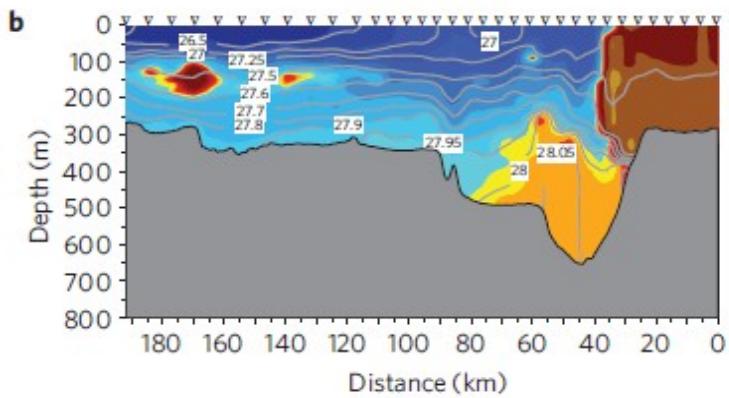

... are well reproduced by the model

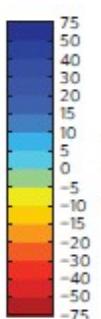

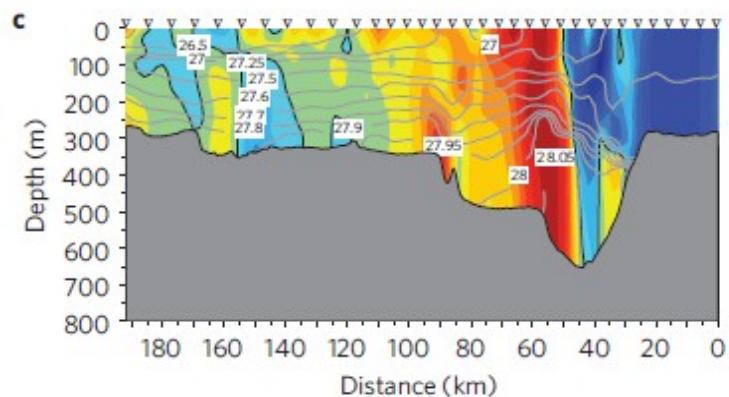

A. Sterl; Argo Workshop, Southampton
20.06.2013

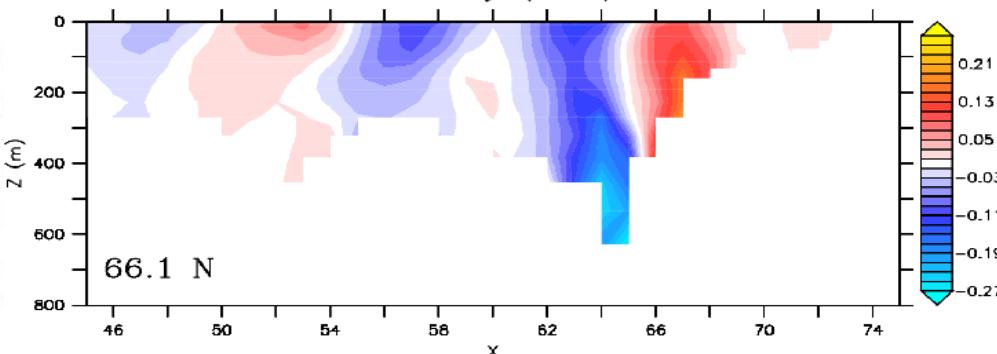

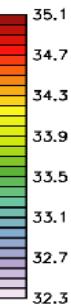

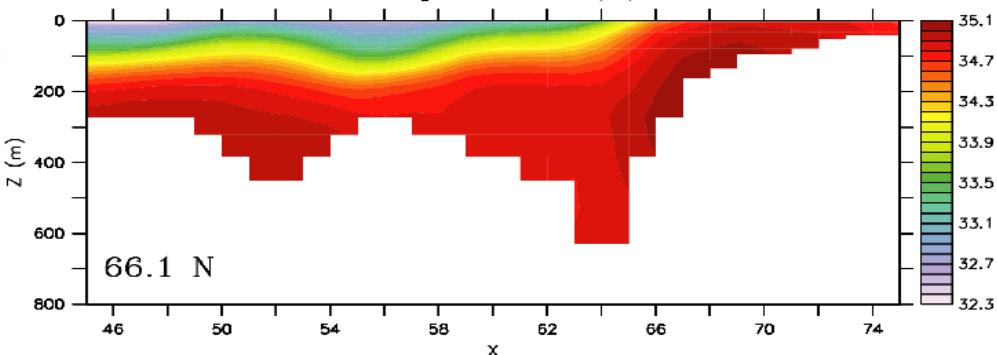

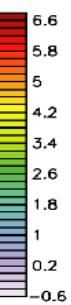

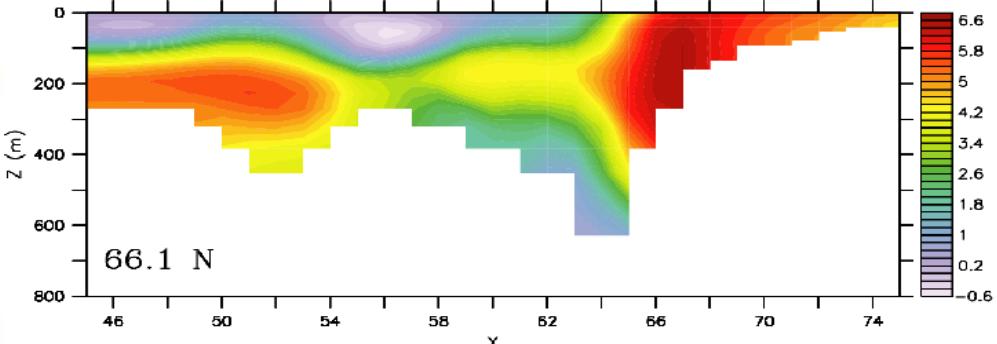

θ (°C)

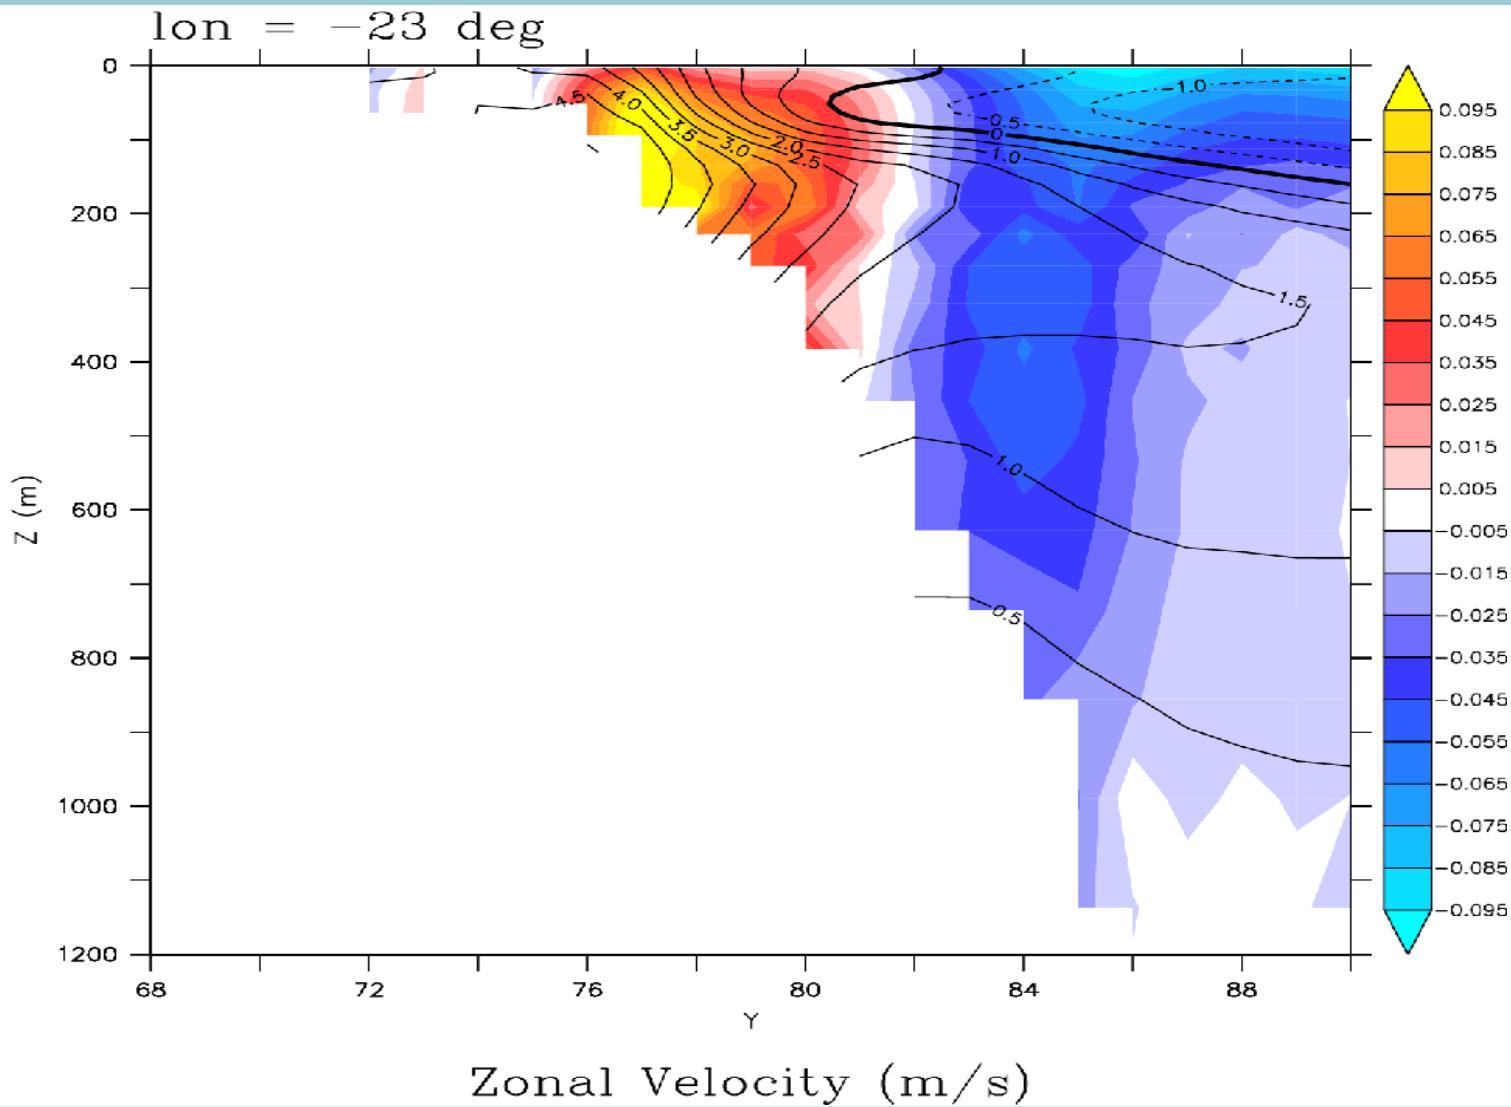

σ

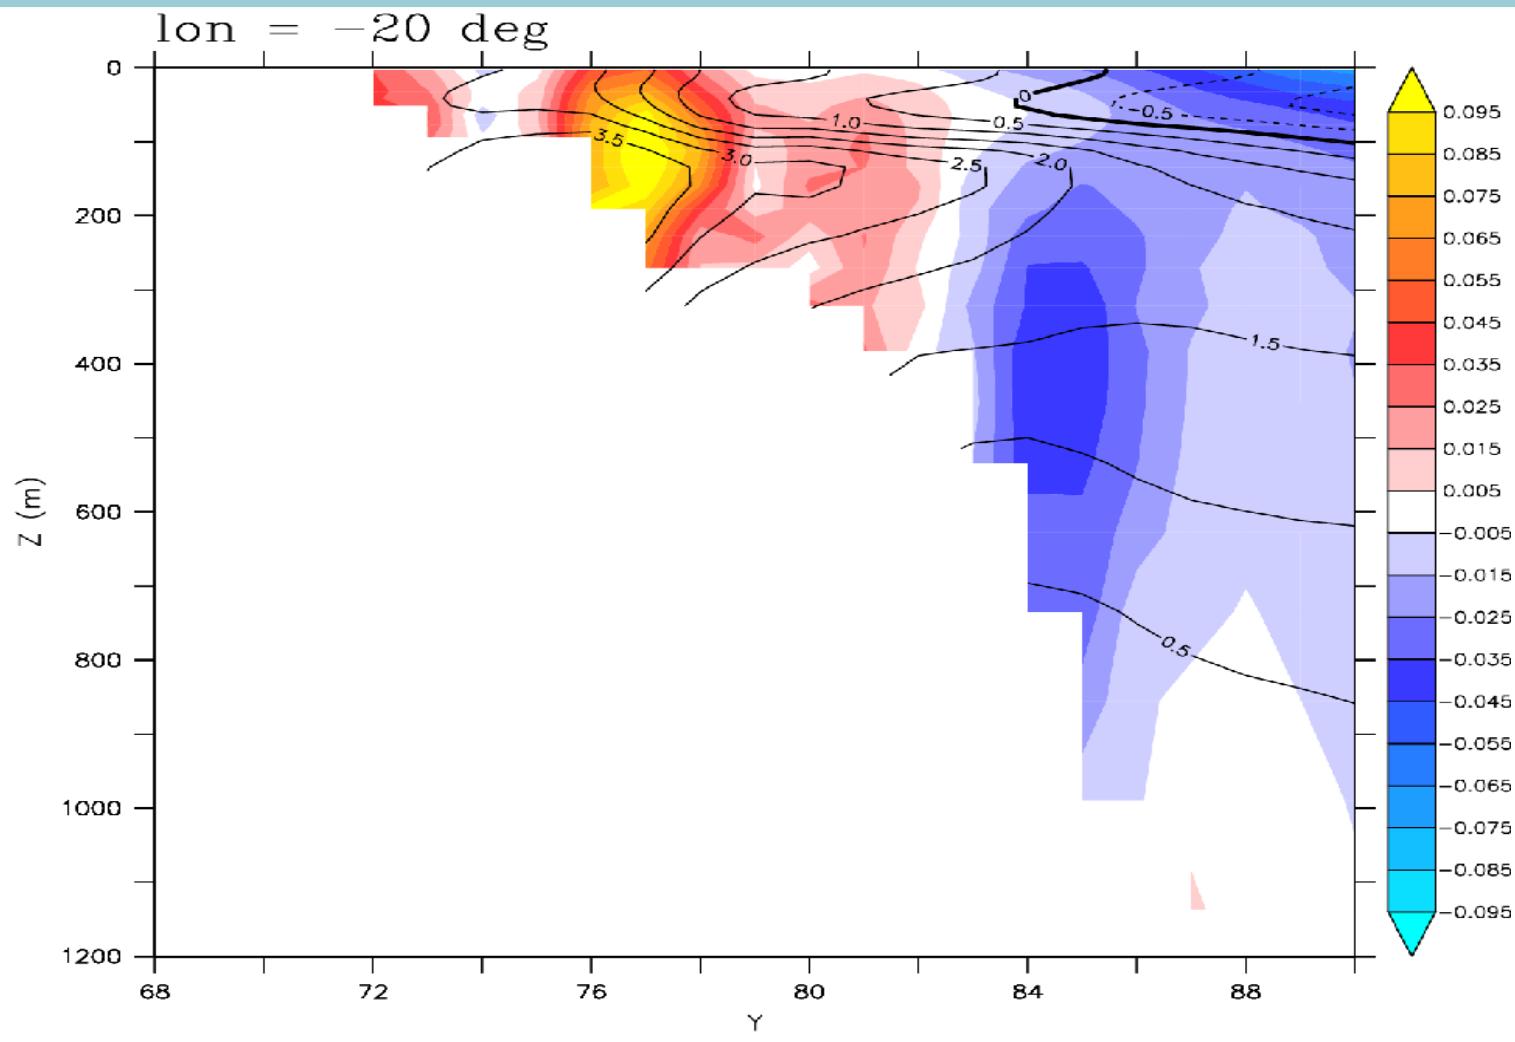

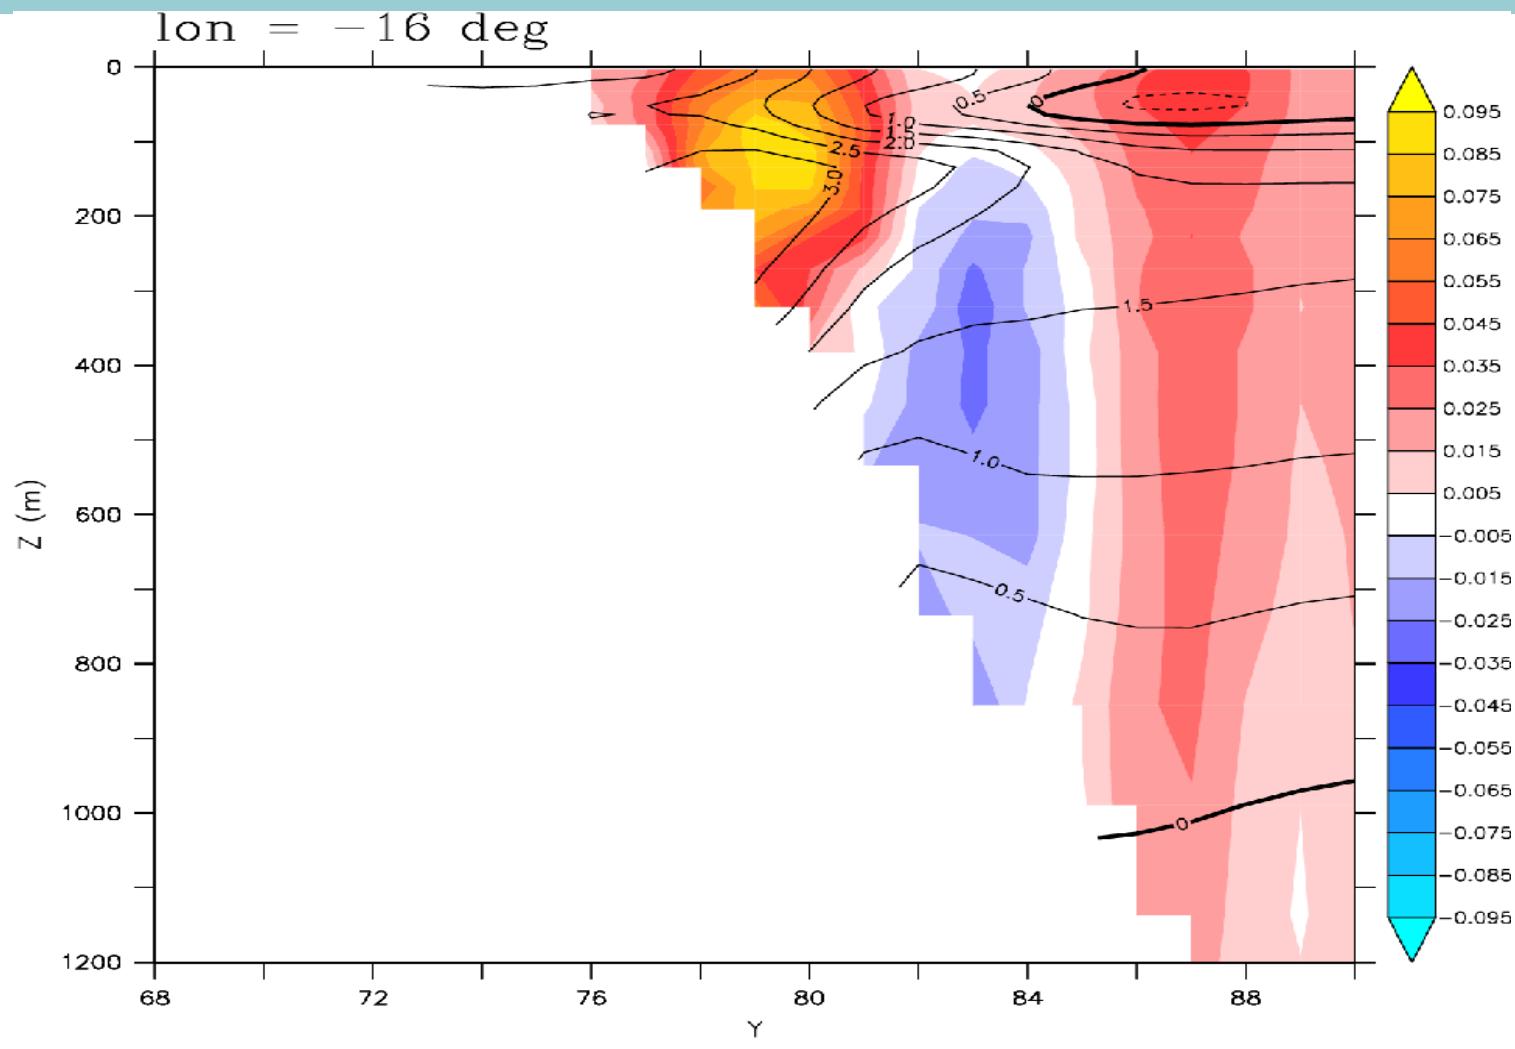

Absolute geostrophic velocity (cm s^{-1})

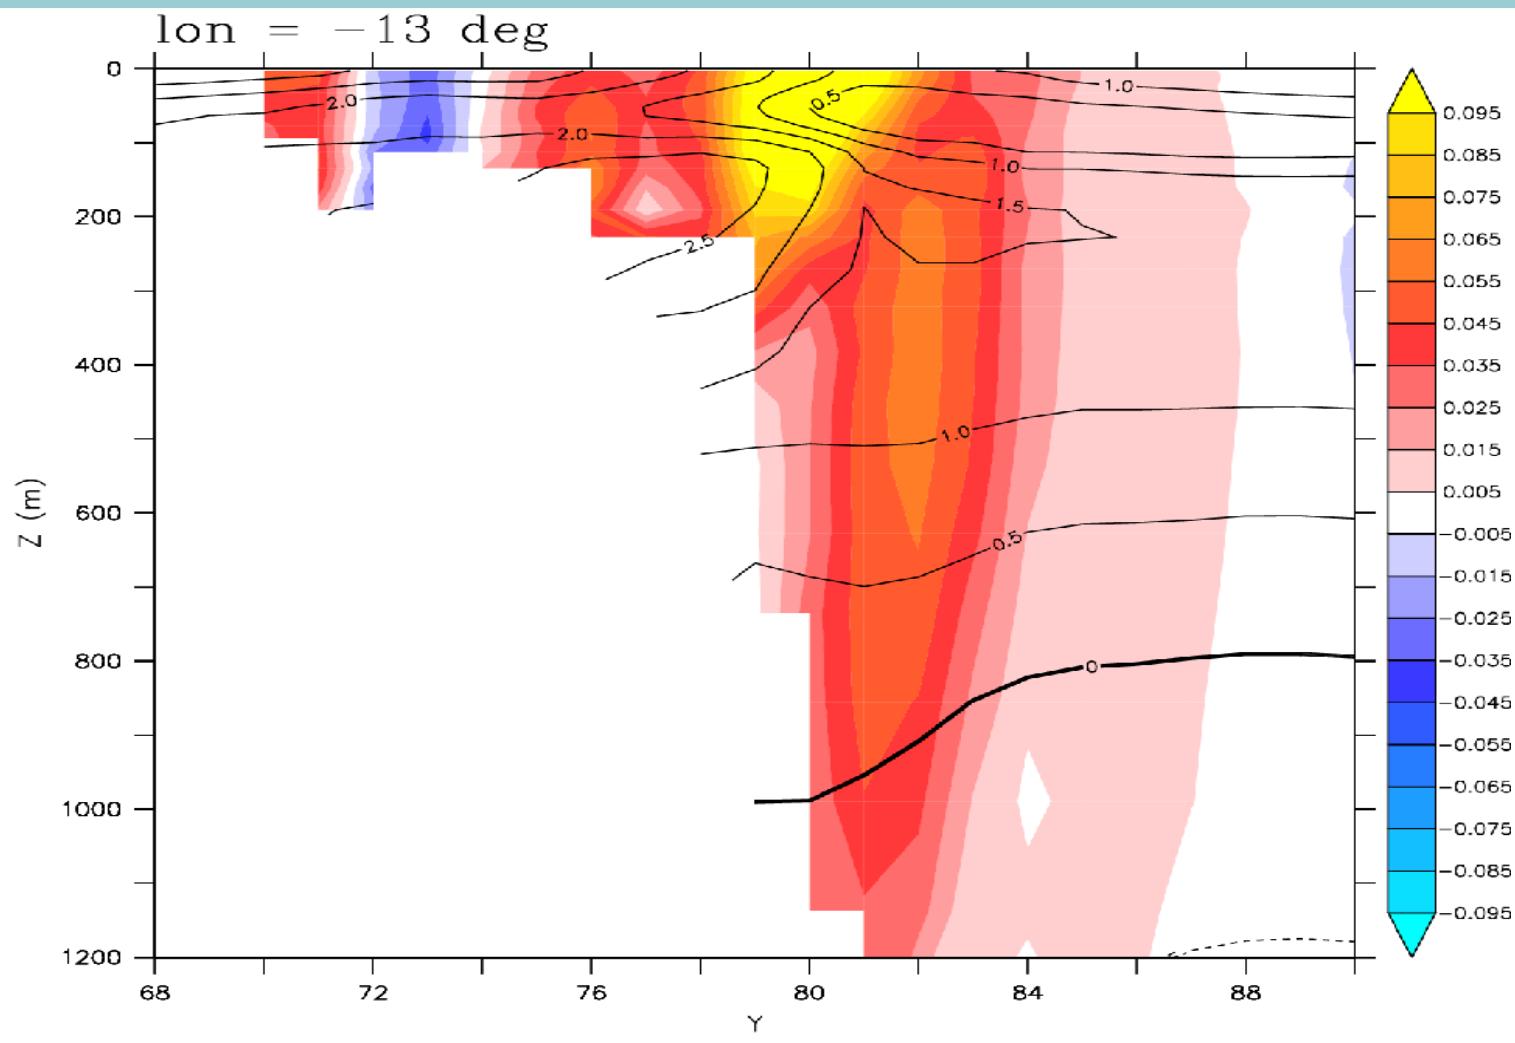

20.06.2013

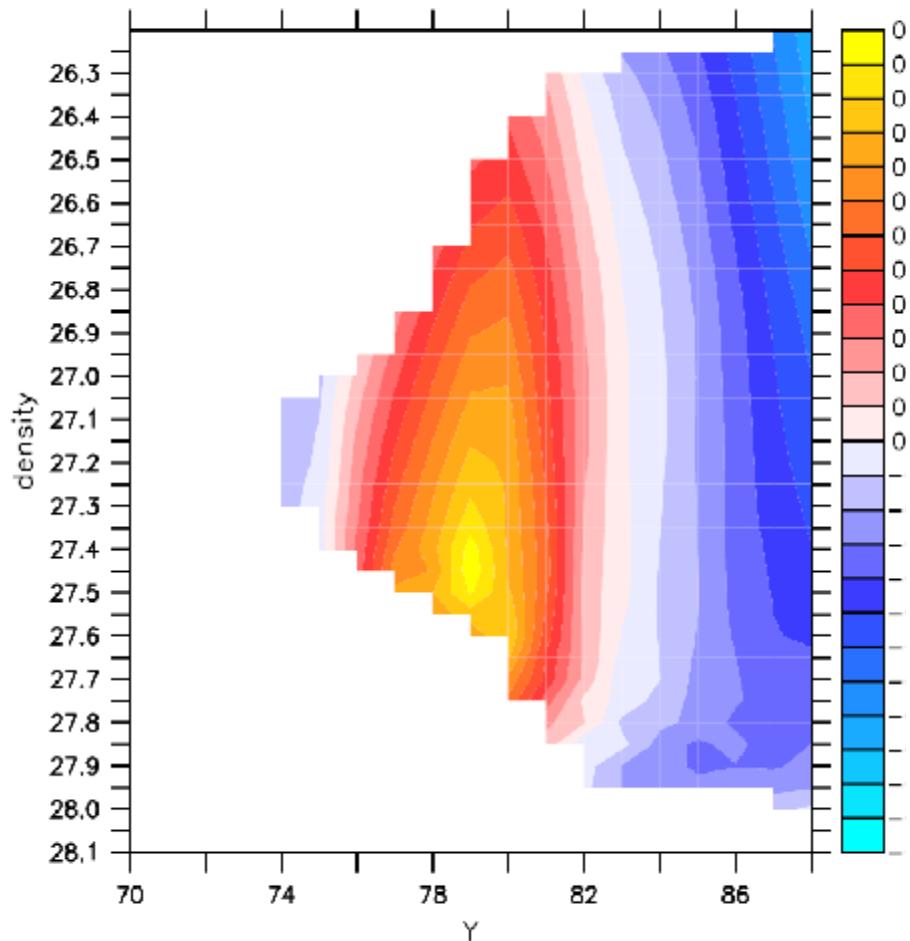

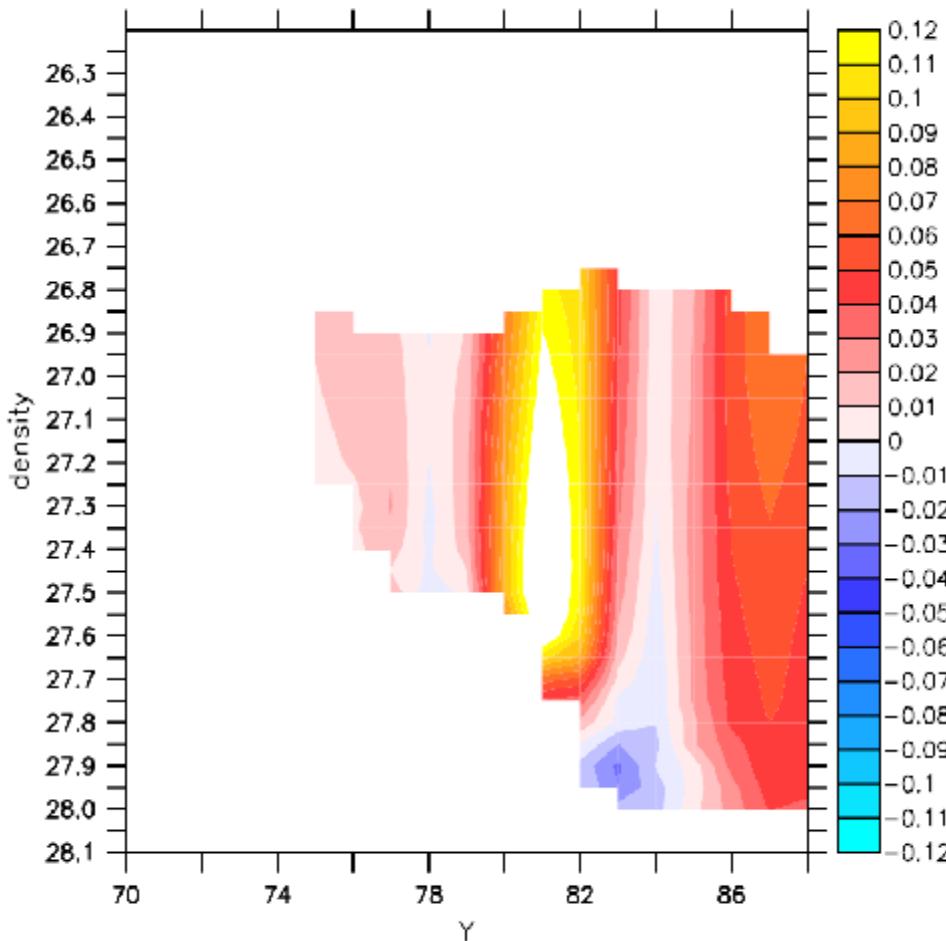

X : 78
TIME : 04-JAN-0006 18:00 to 22-DEC-0049 05:59

Mean zonal current vs density north of Icel

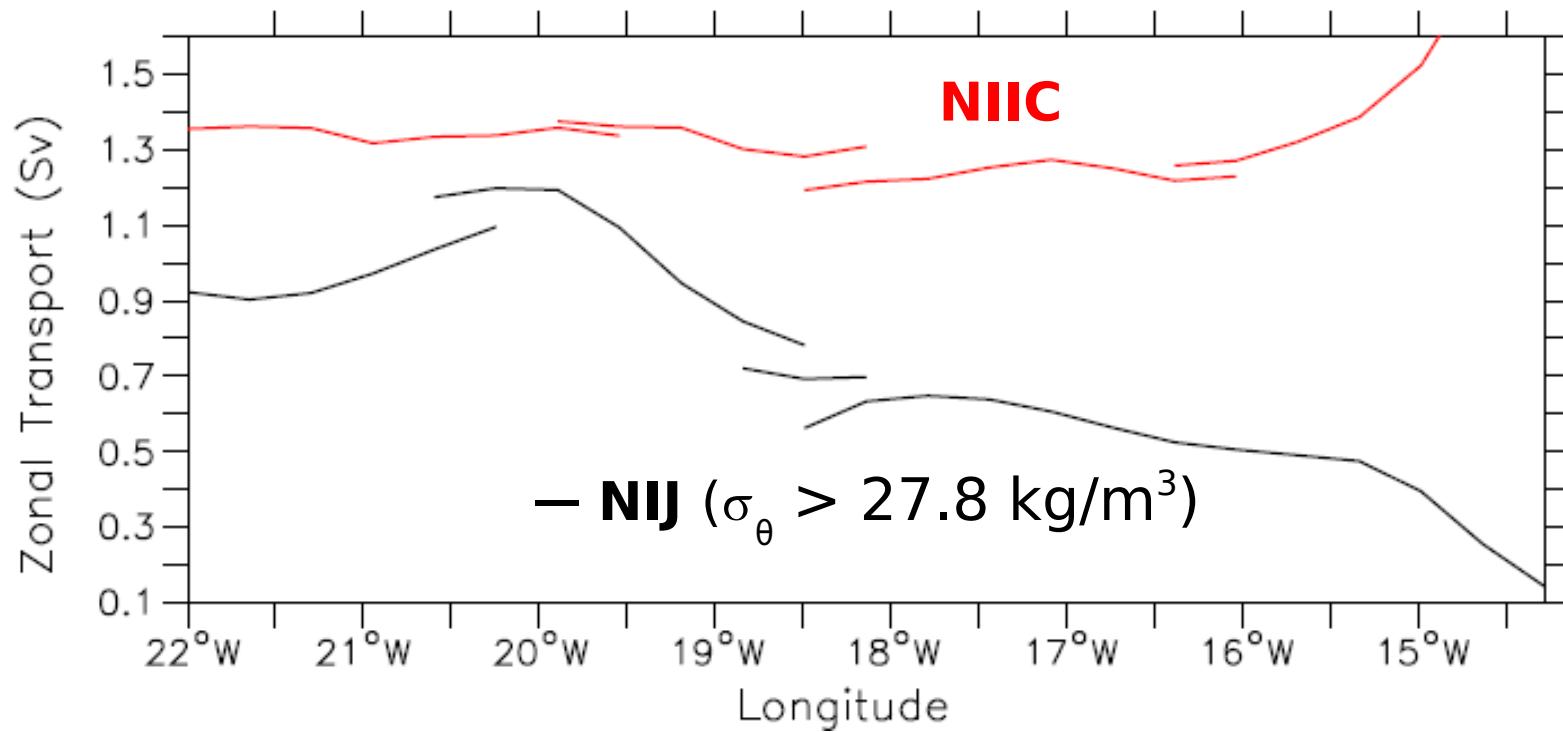

X : 98
TIME : 04-JAN-0006 18:00 to 22-DEC-0049 05:59

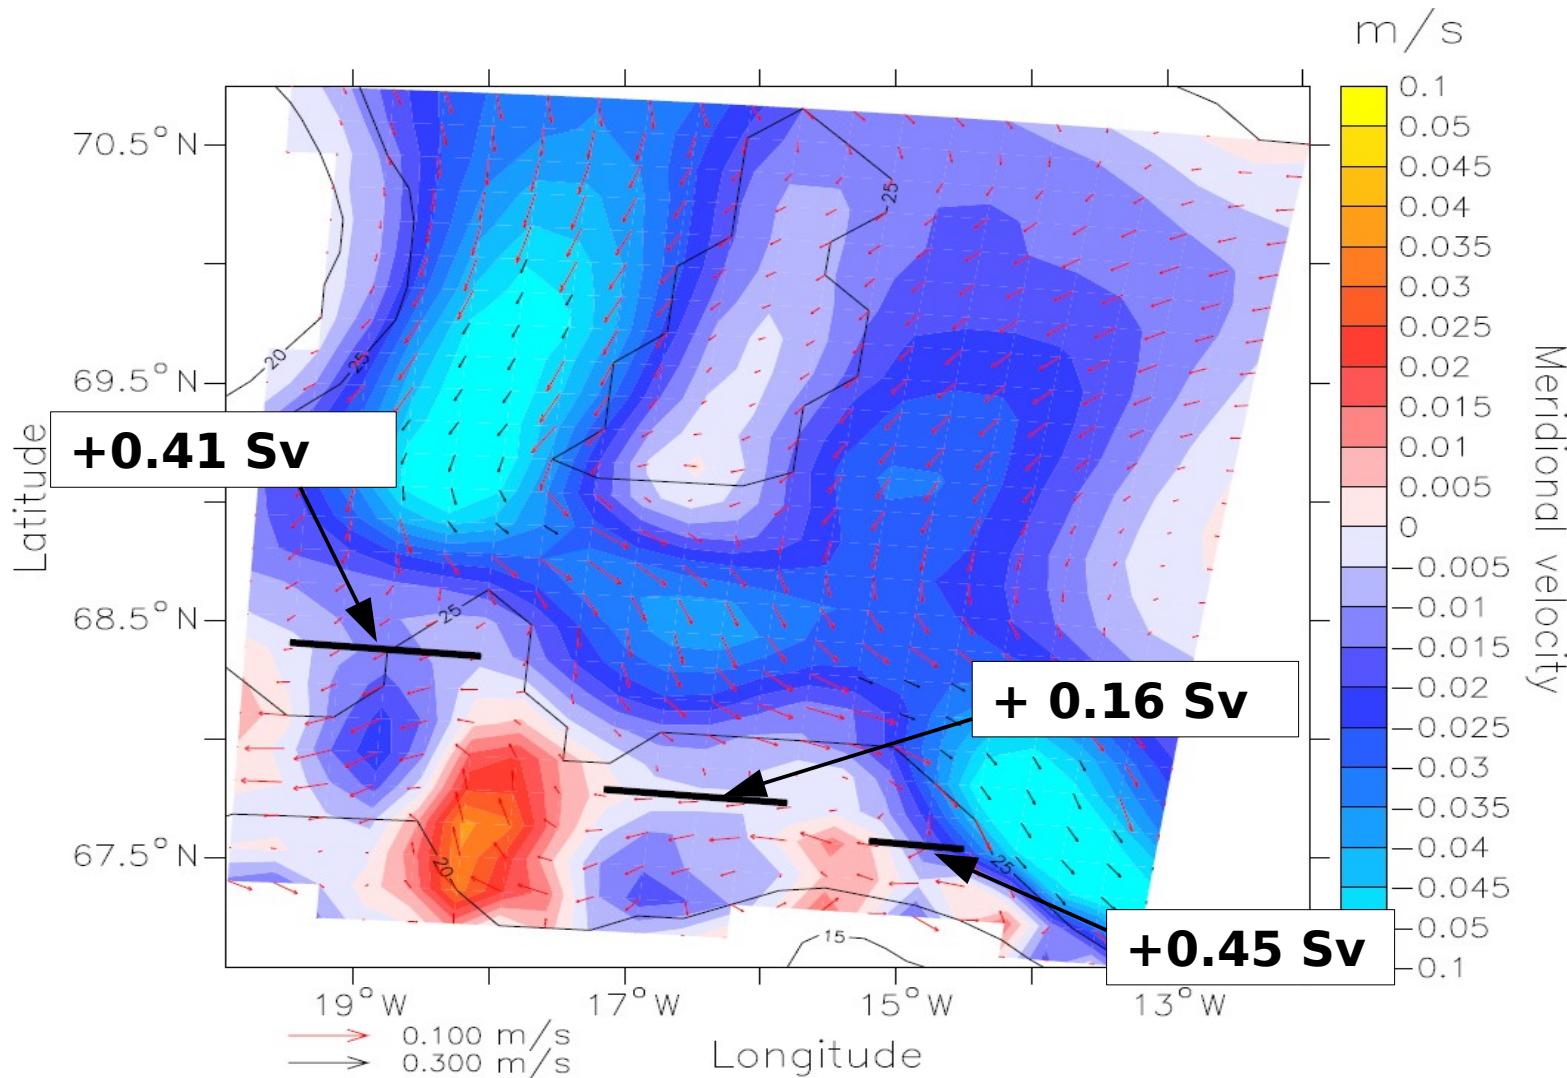

Mean zonal current vs density north of Icel

Transports along path of NIIC and NIJ

NIIC

- Flows eastward along north coast of Iceland
- Depth range 100 – 200 m
- Joins Nordic Seas rim current at the NE corner of Iceland
- Cools/densifies at surface, but not at depth
- Hardly loses mass (0.1 Sv sinking)
- No interaction with NIJ (no correlations)

NIJ

- Flows westward along north coast of Iceland
- Depth range surface to bottom, but maximum around 400 m
- Does not exist east of 14-15 °W
- Increases from 0.1 to 1 Sv
- Hardly any densification
- Is fed by Nordic Seas rim current
- Contributes about 1/3 of DSOW

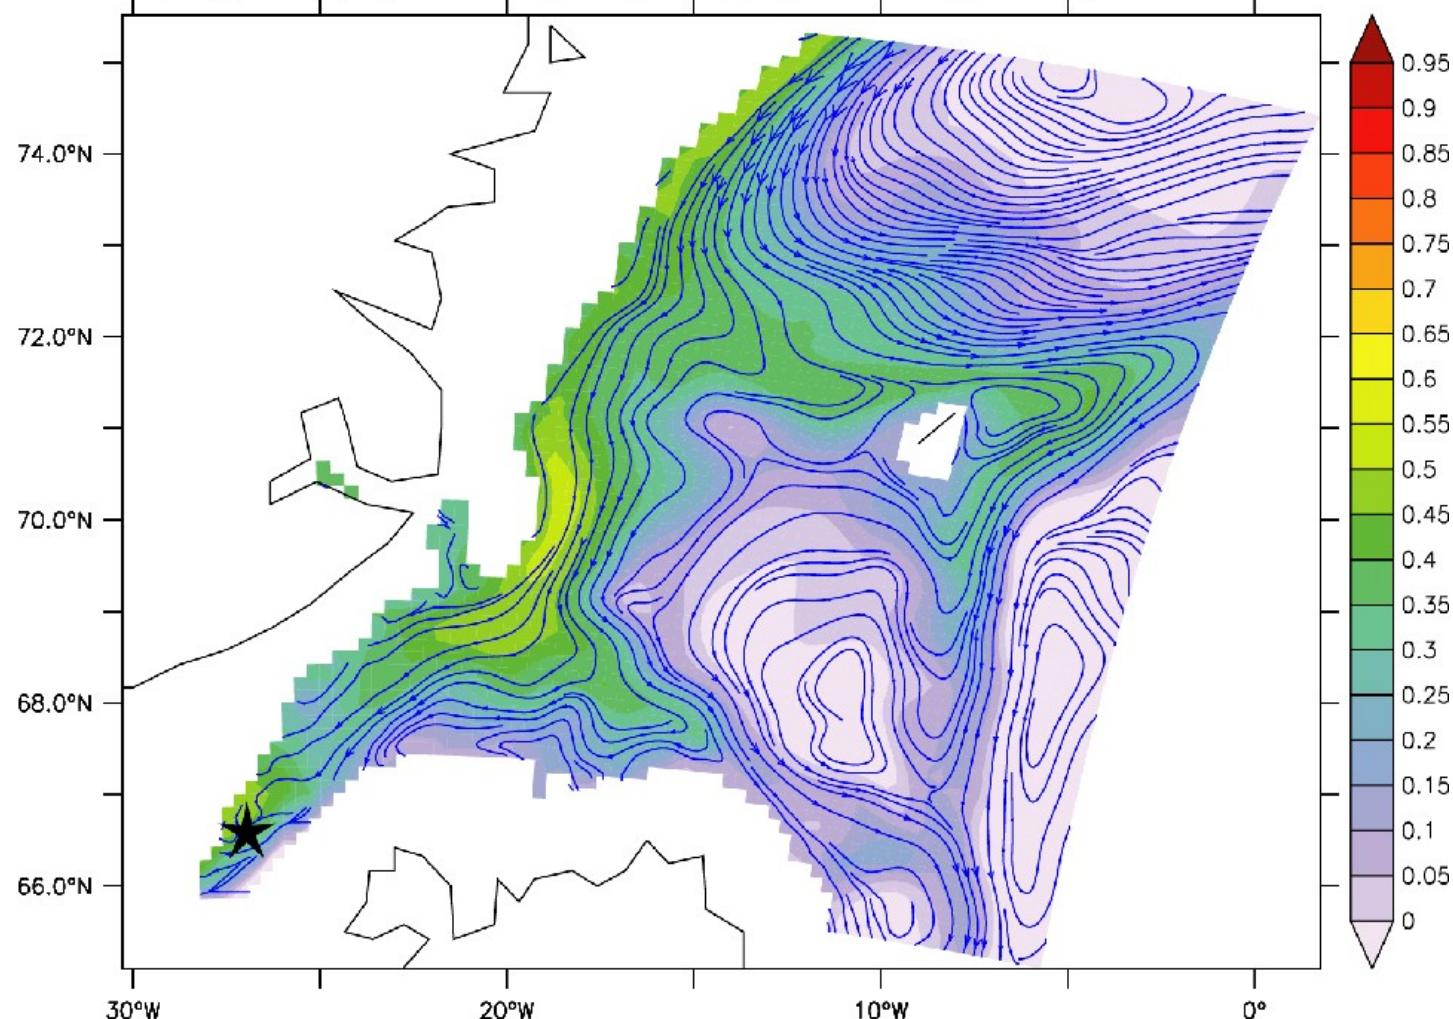

Where does DSOW come from?

1. intermediate depth (400 m), western slope

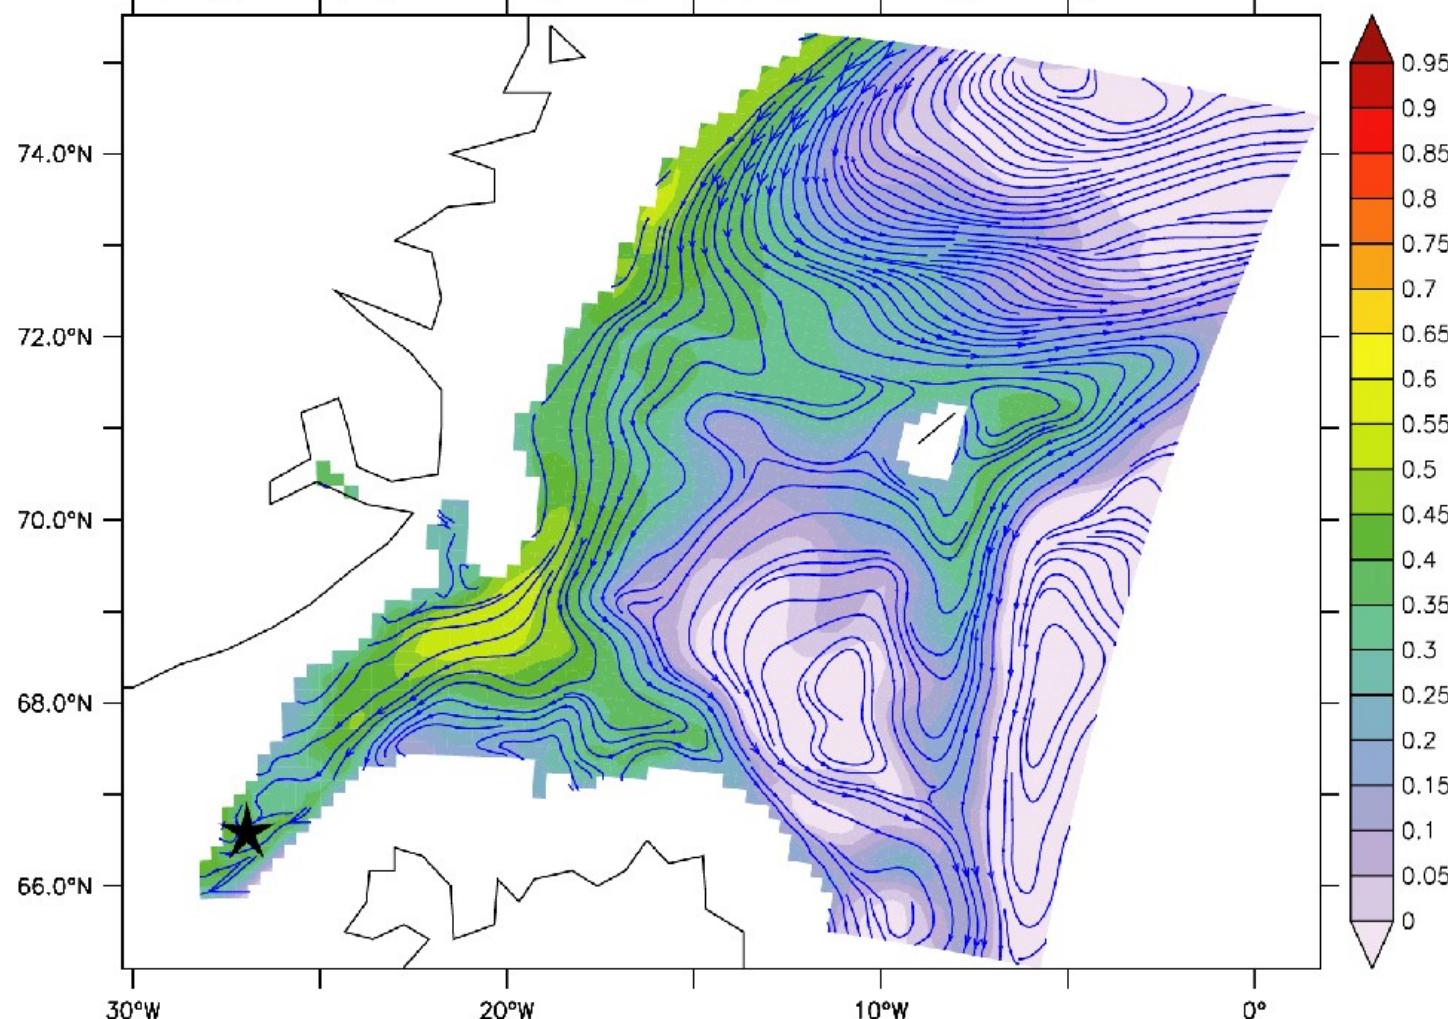

Corr(sigma_0[z=382],sigma_0[z=382]), lag=-10

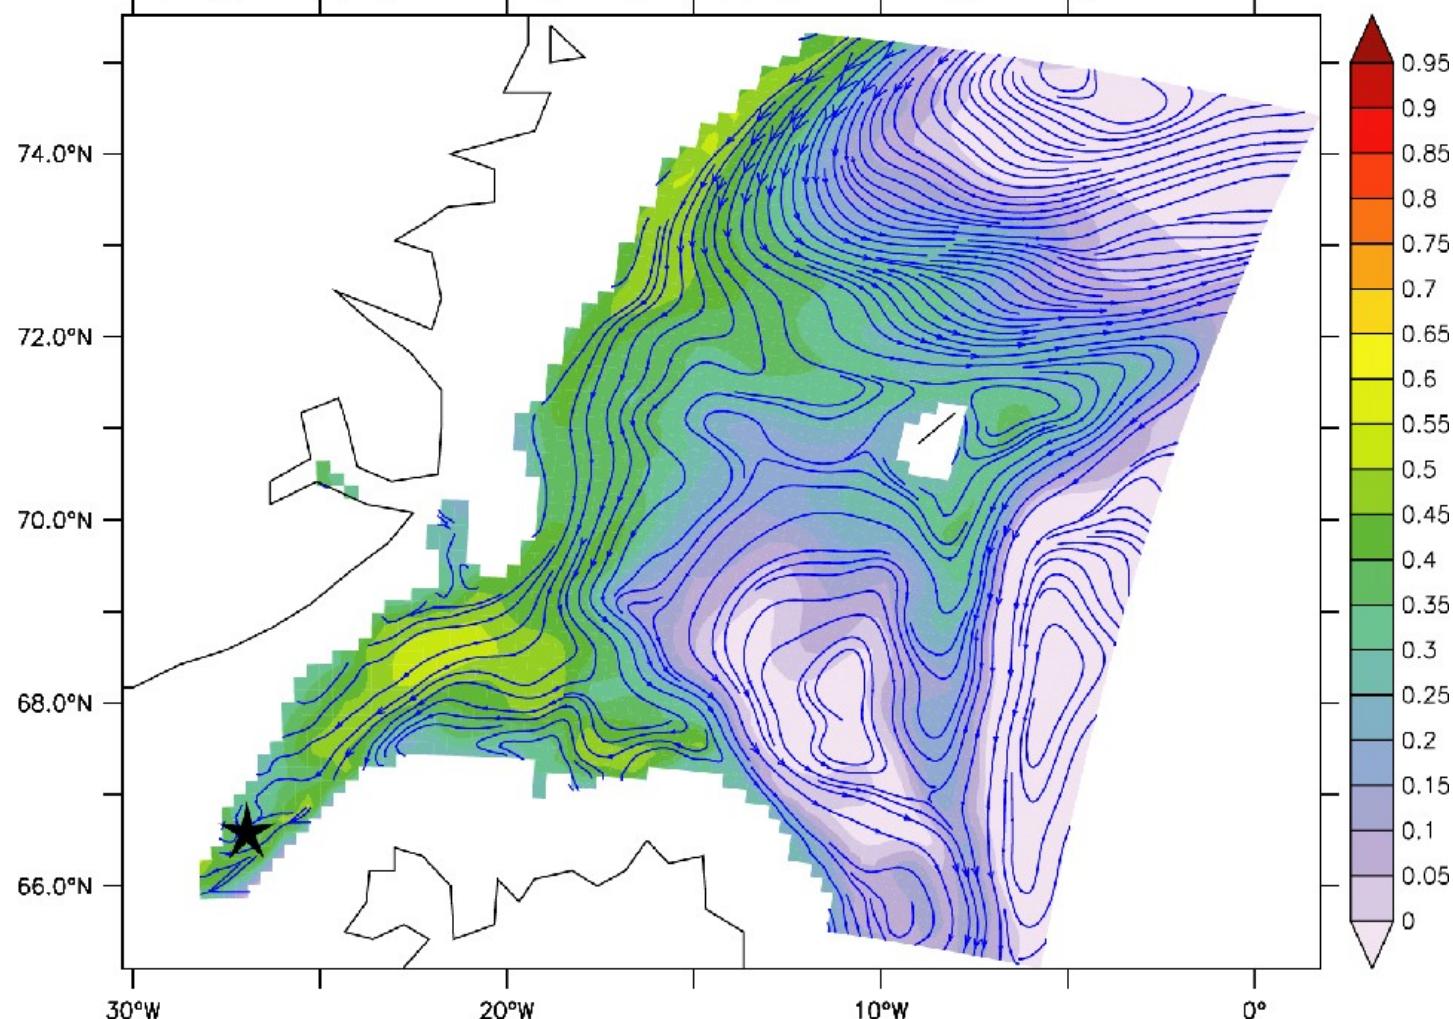

Corr(sigma_0[z=382],sigma_0[z=382]), lag=-8

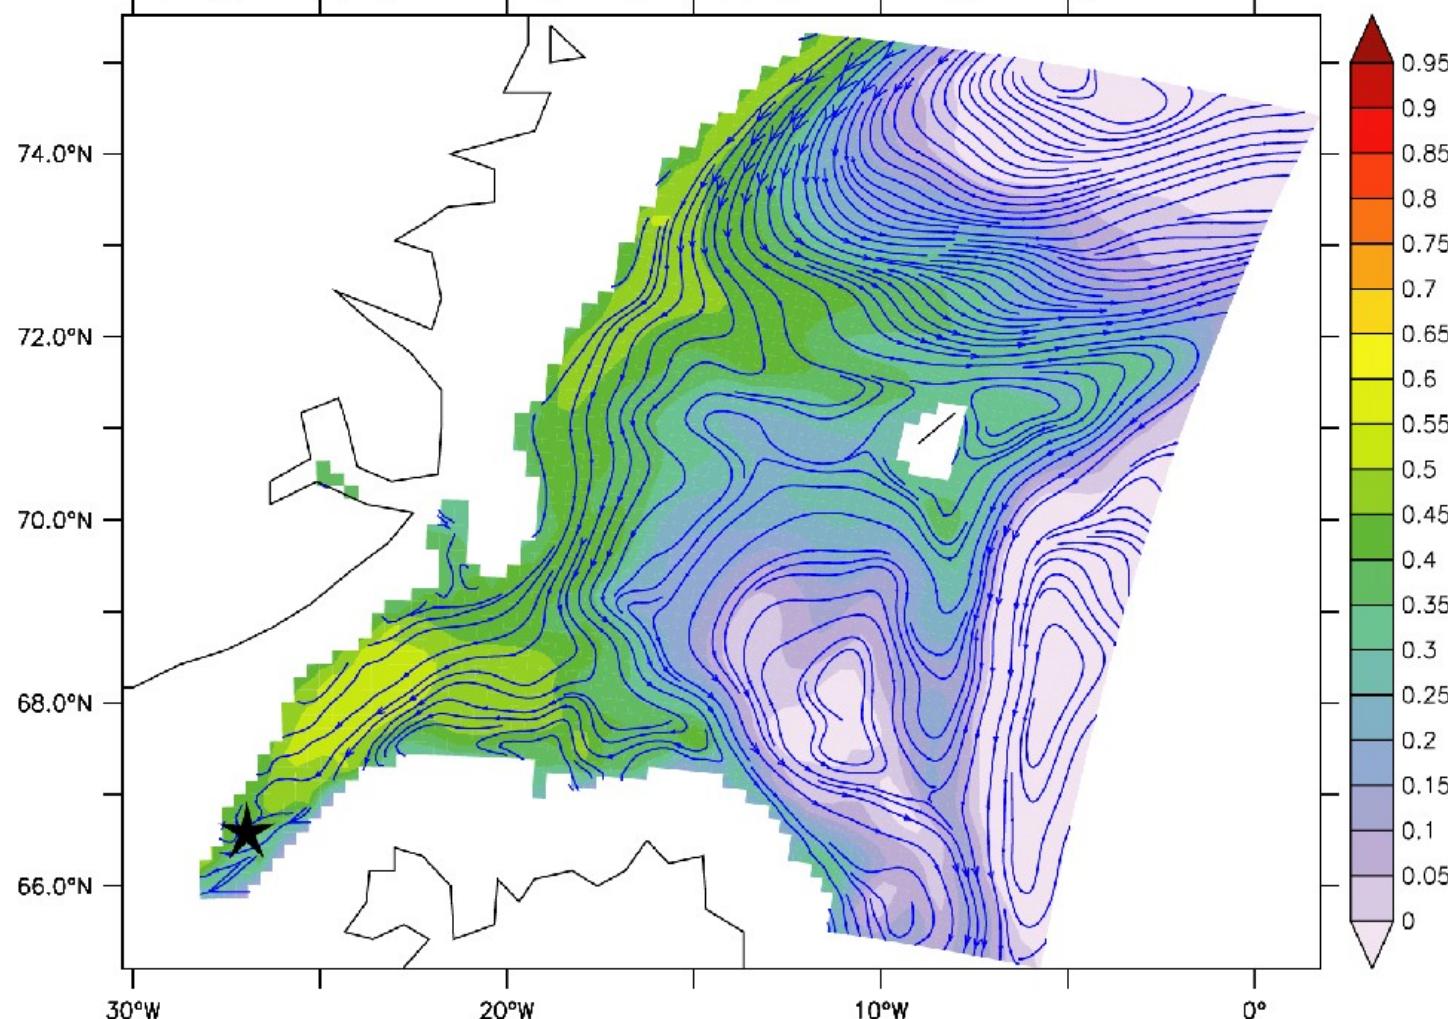

Corr(sigma_0[z=382],sigma_0[z=382]), lag=-6

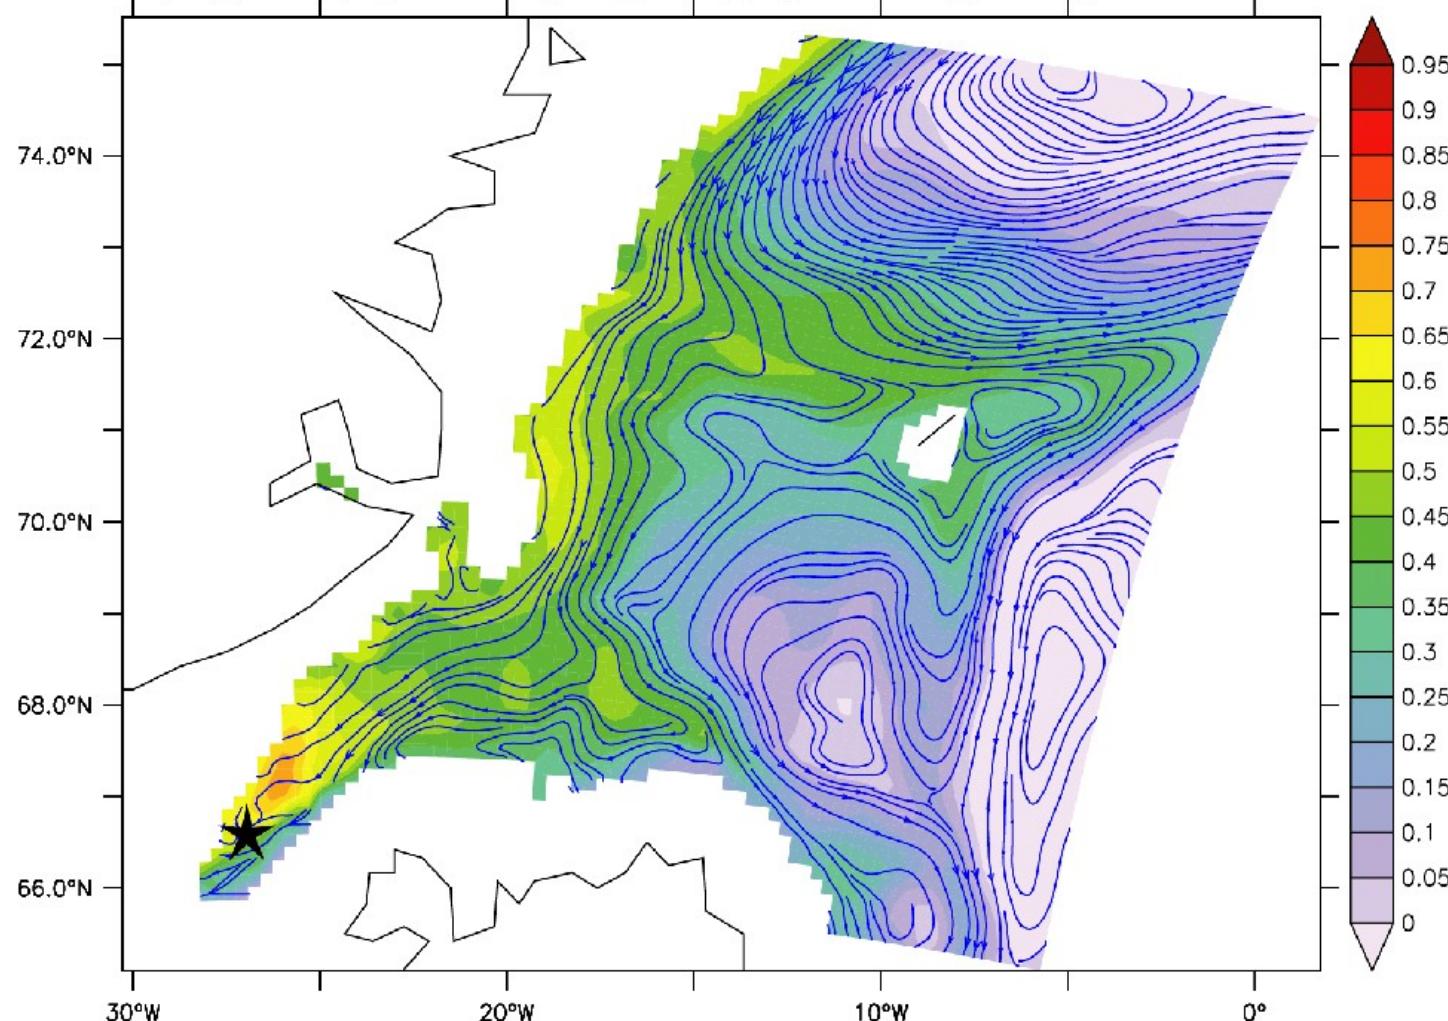

Corr(sigma_0[z=382],sigma_0[z=382]), lag=-4

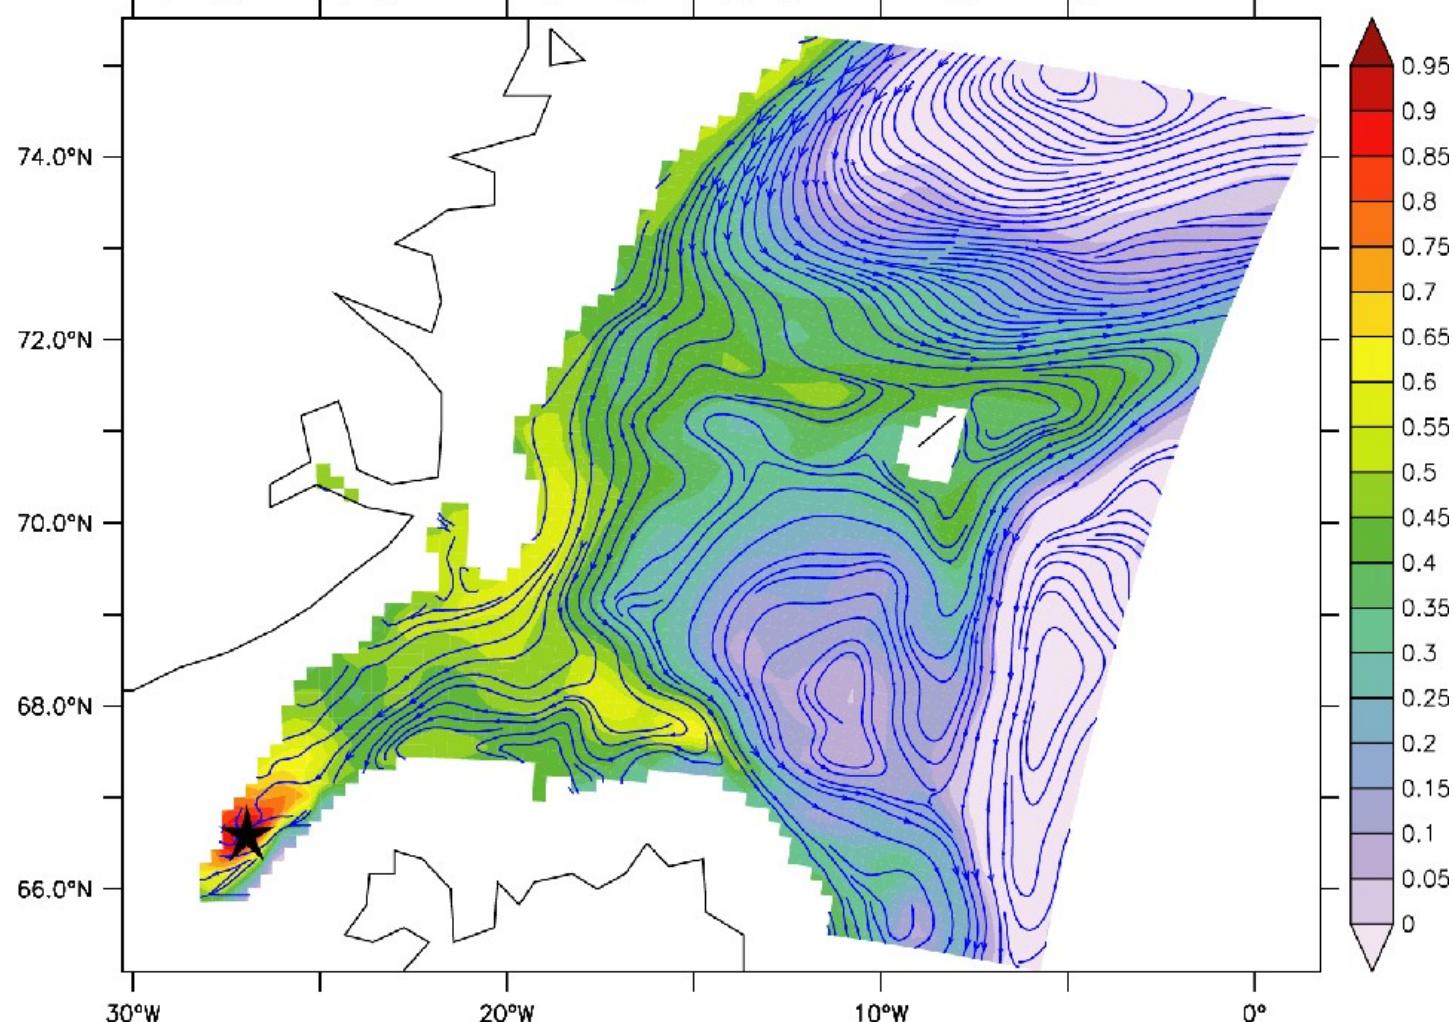

Corr(sigma_0[z=382],sigma_0[z=382]), lag=-2

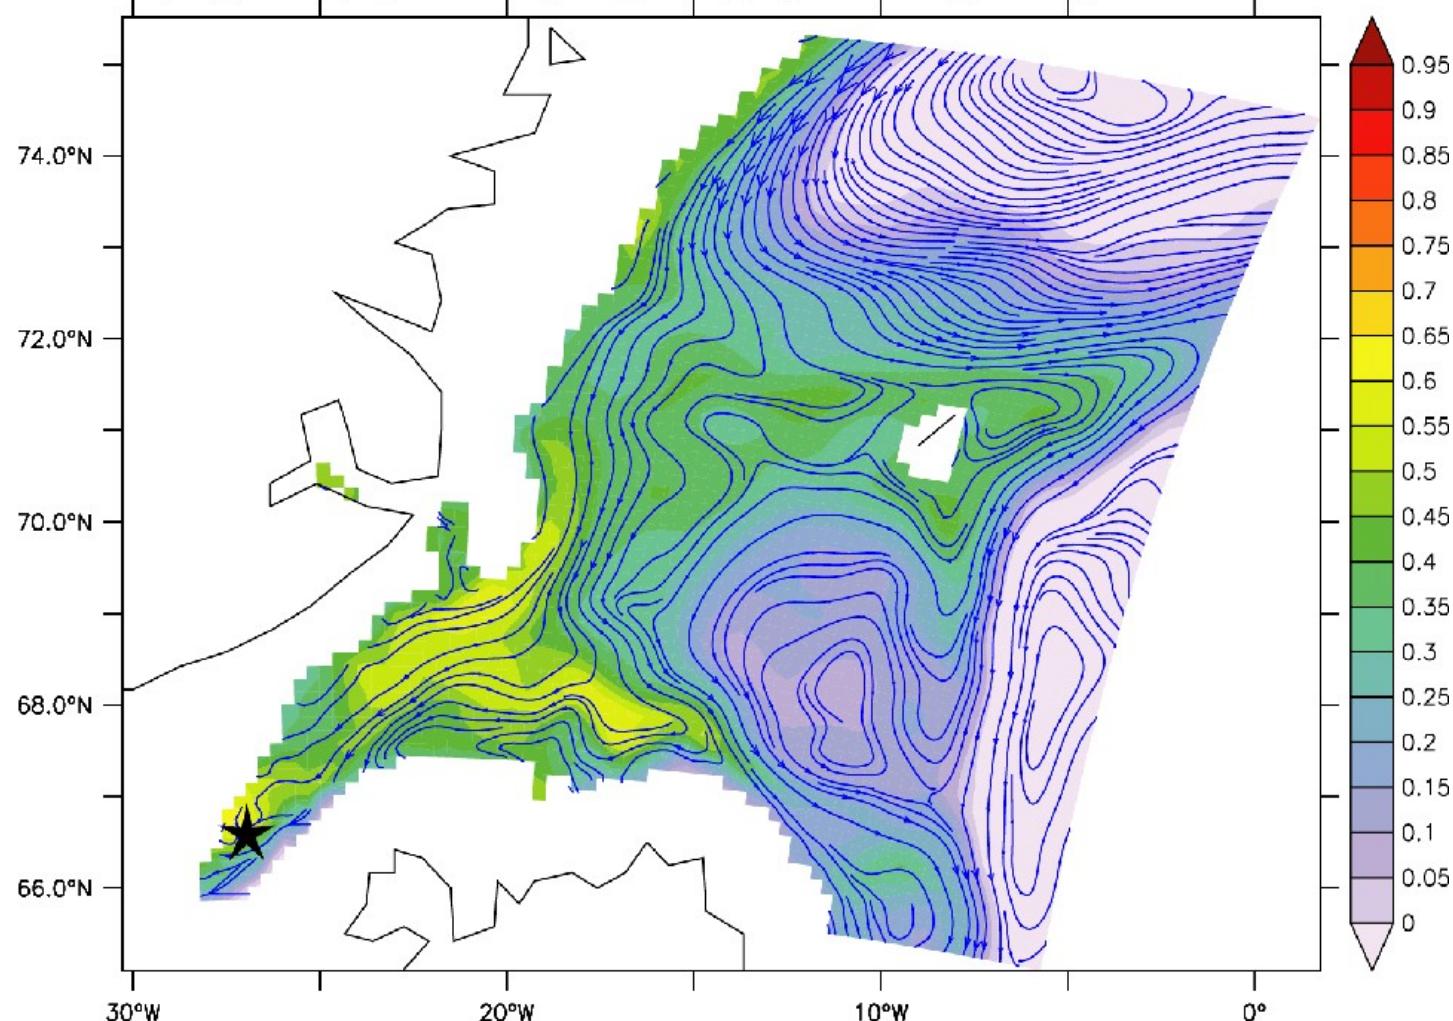

Corr(sigma_0[z=382],sigma_0[z=382]), lag=0

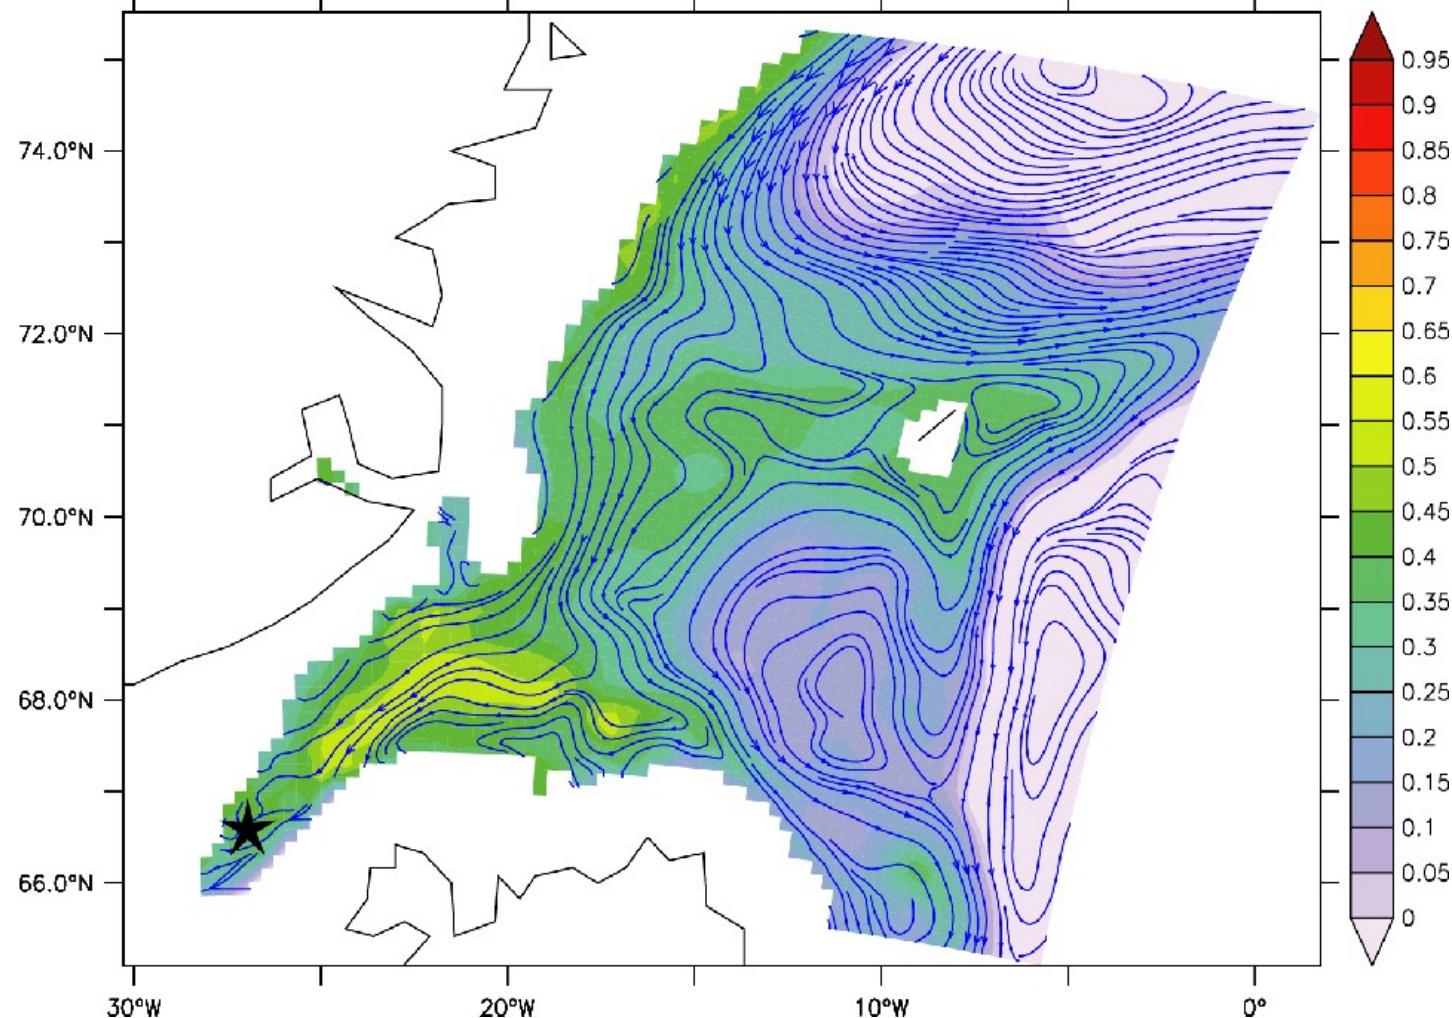

Corr(sigma_0[z=382],sigma_0[z=382]), lag=2

Corr(sigma_0[z=382],sigma_0[z=382]), lag=4

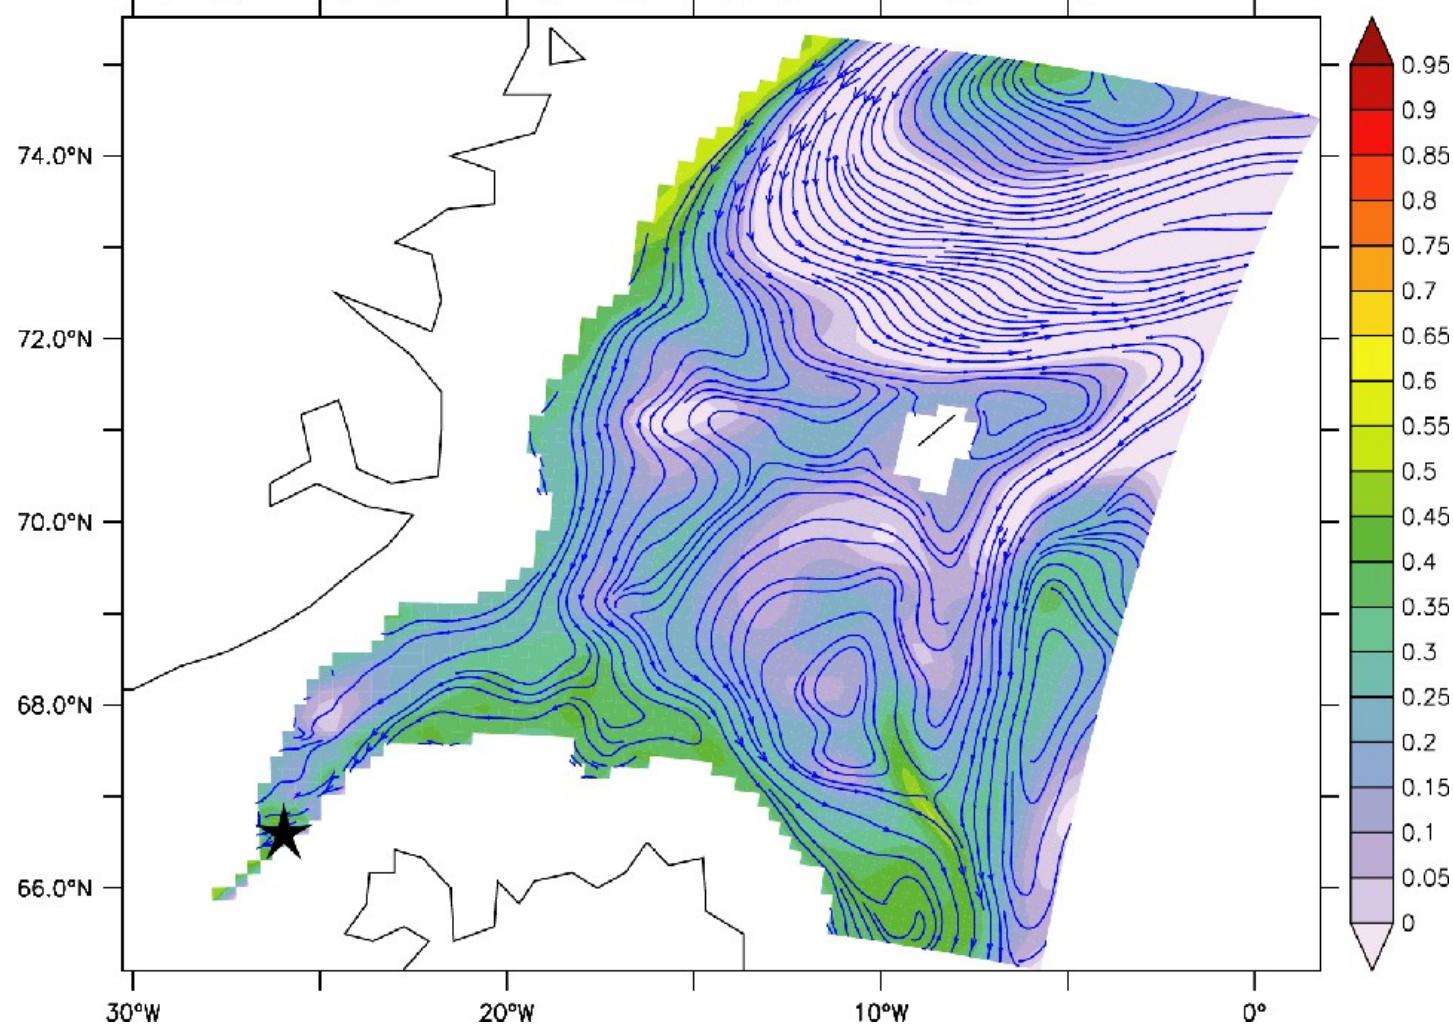

Where does DSOW come from?

2. deep (534 m), eastern slope

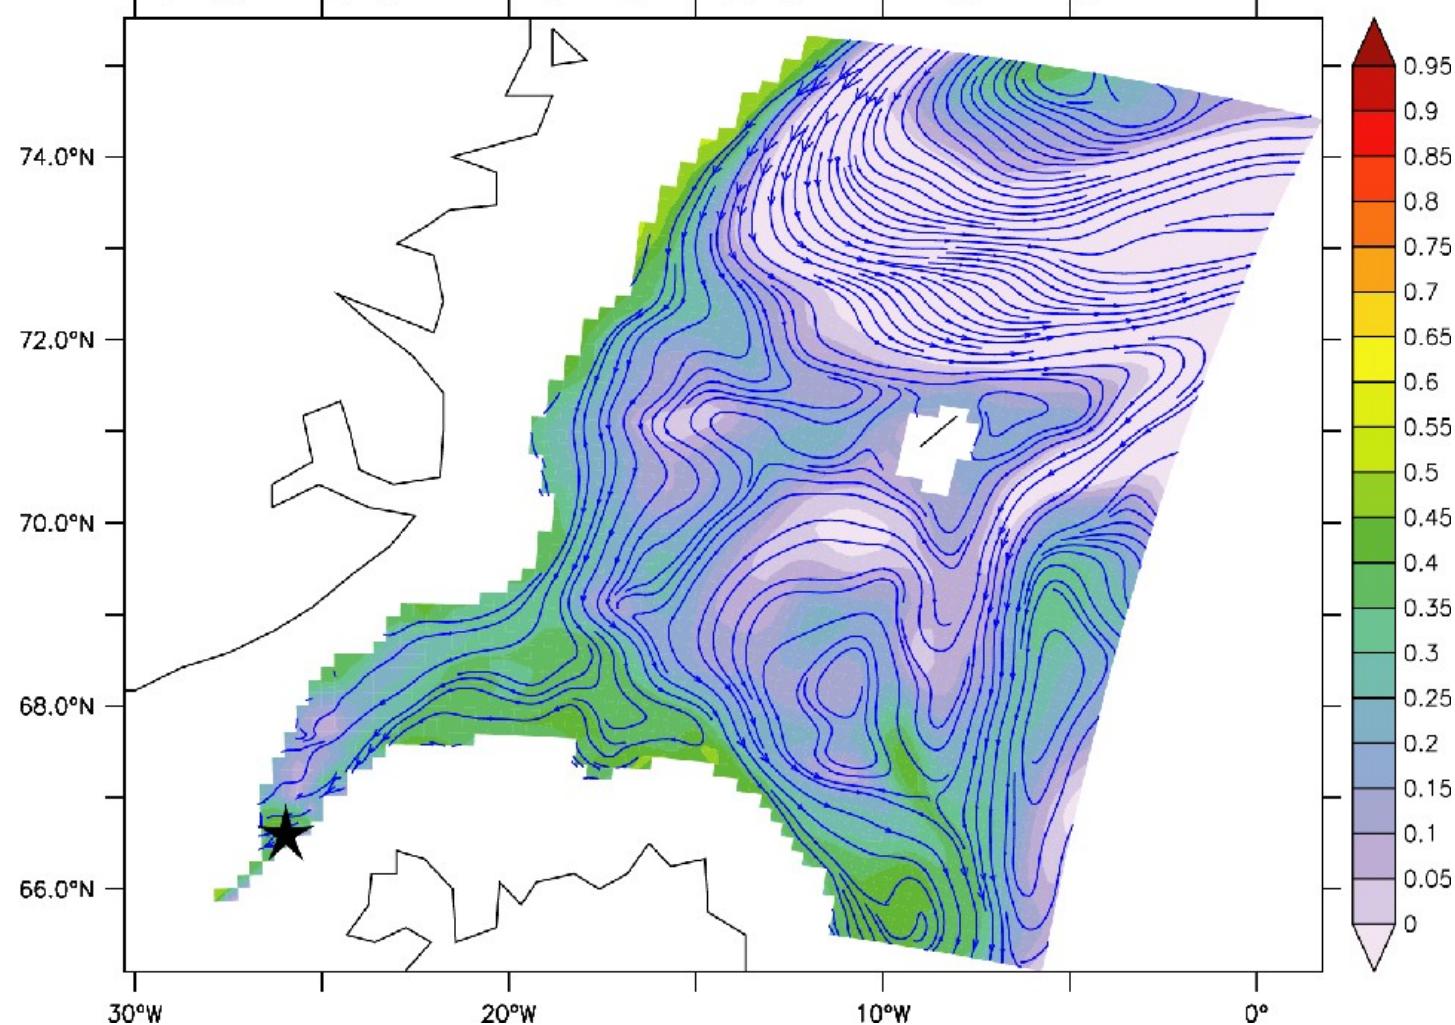

Corr(sigma_0[z=534],sigma_0[z=534]), lag=-10

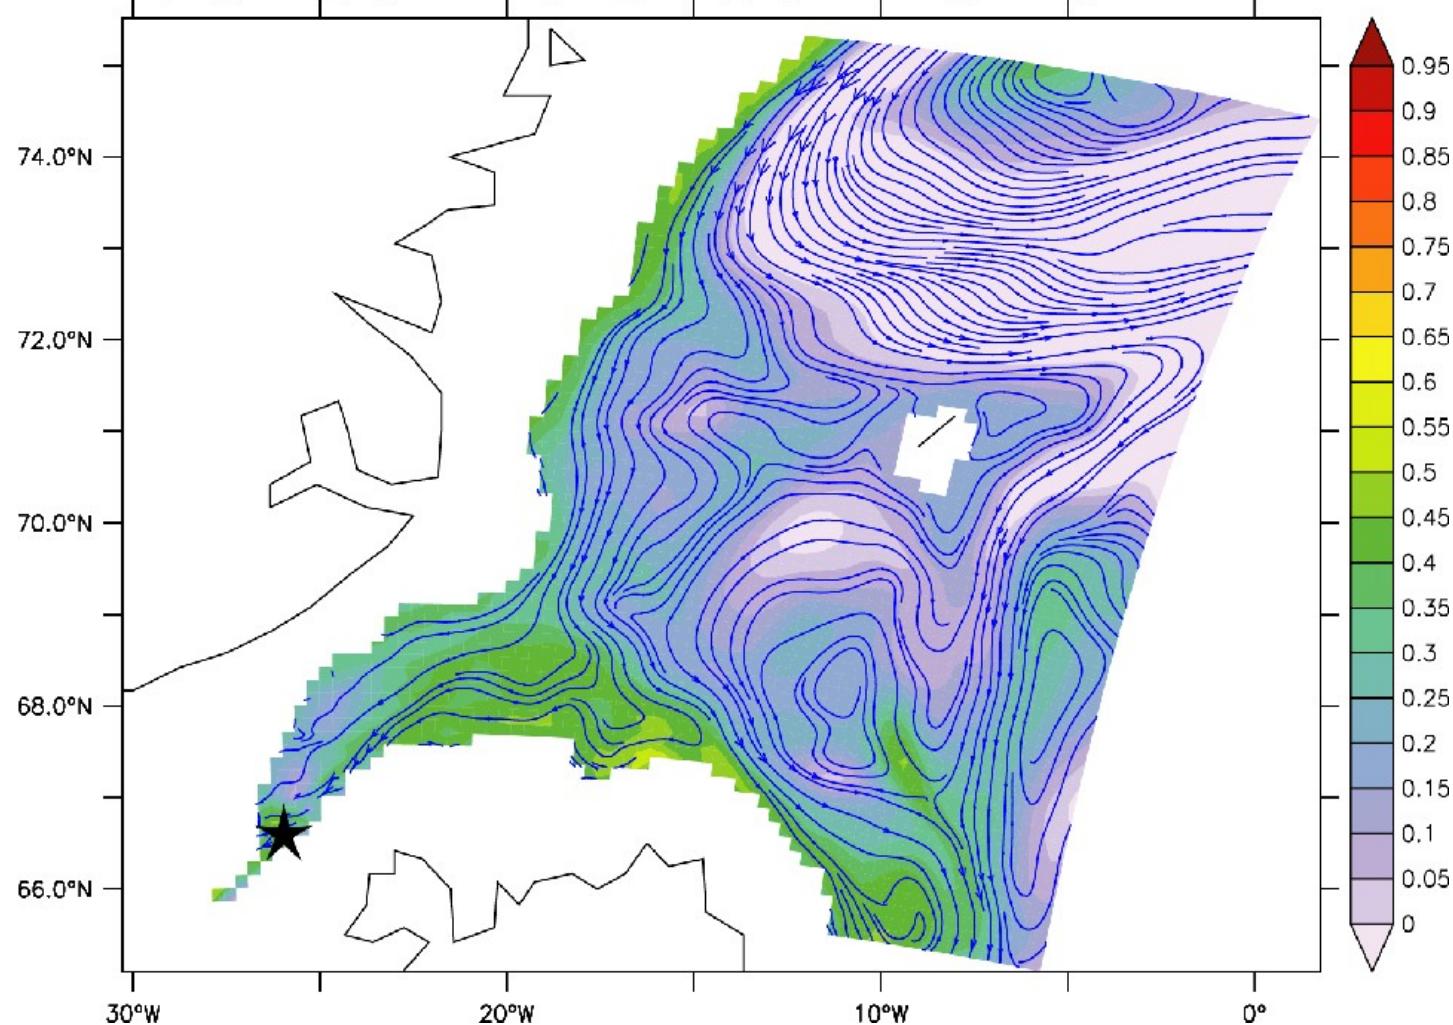

Corr(sigma_0[z=534],sigma_0[z=534]), lag=-8

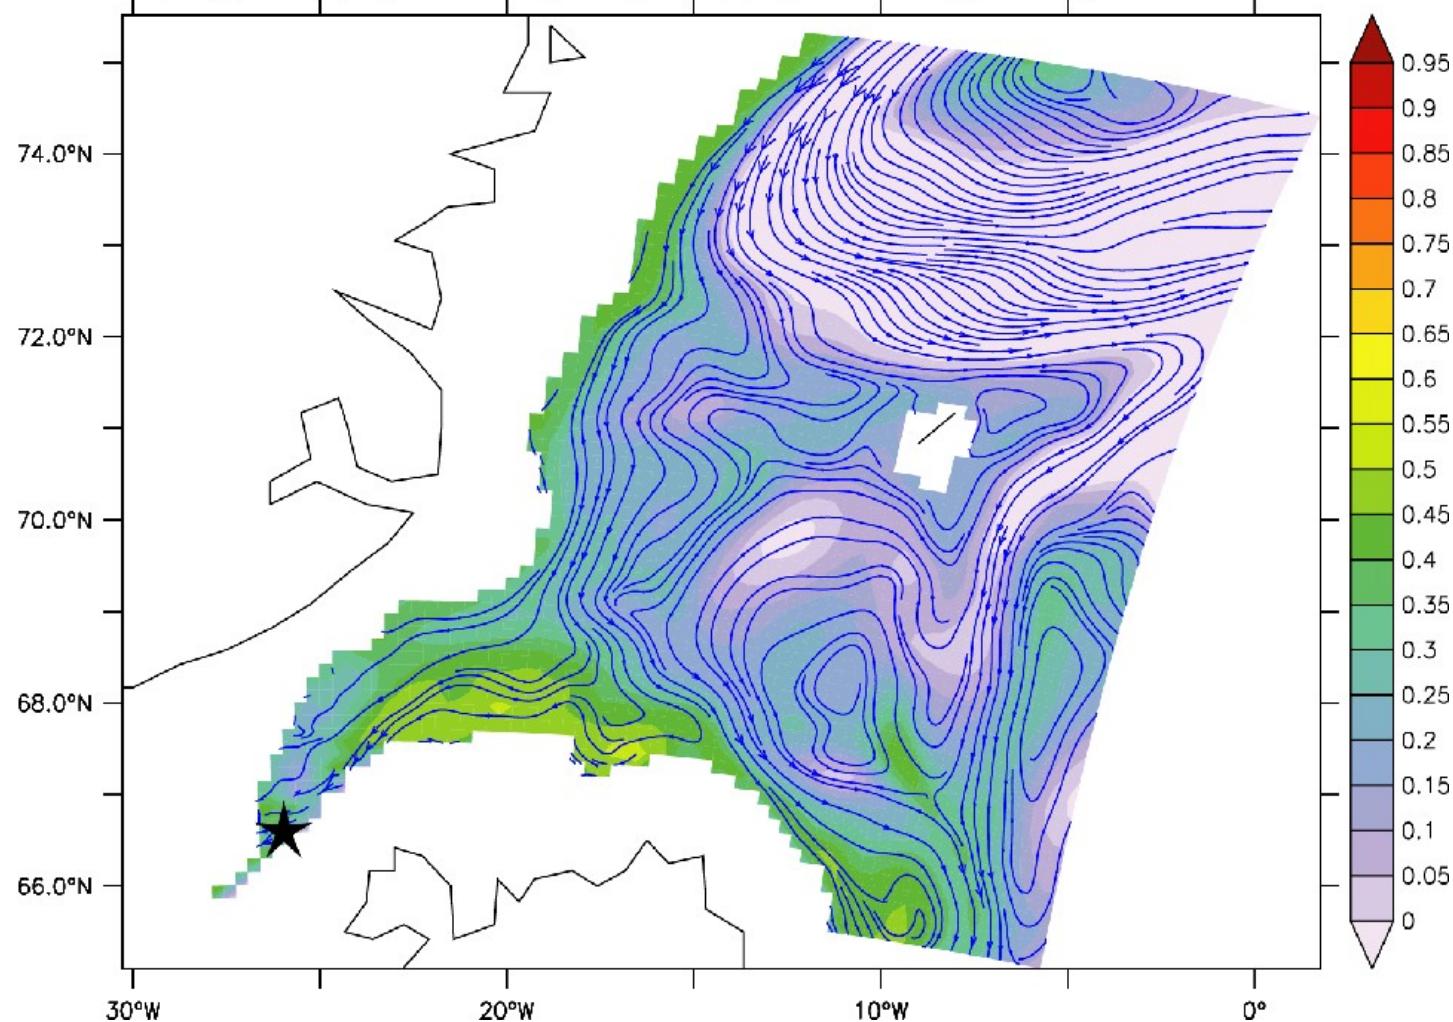

Corr(sigma_0[z=534],sigma_0[z=534]), lag=-6

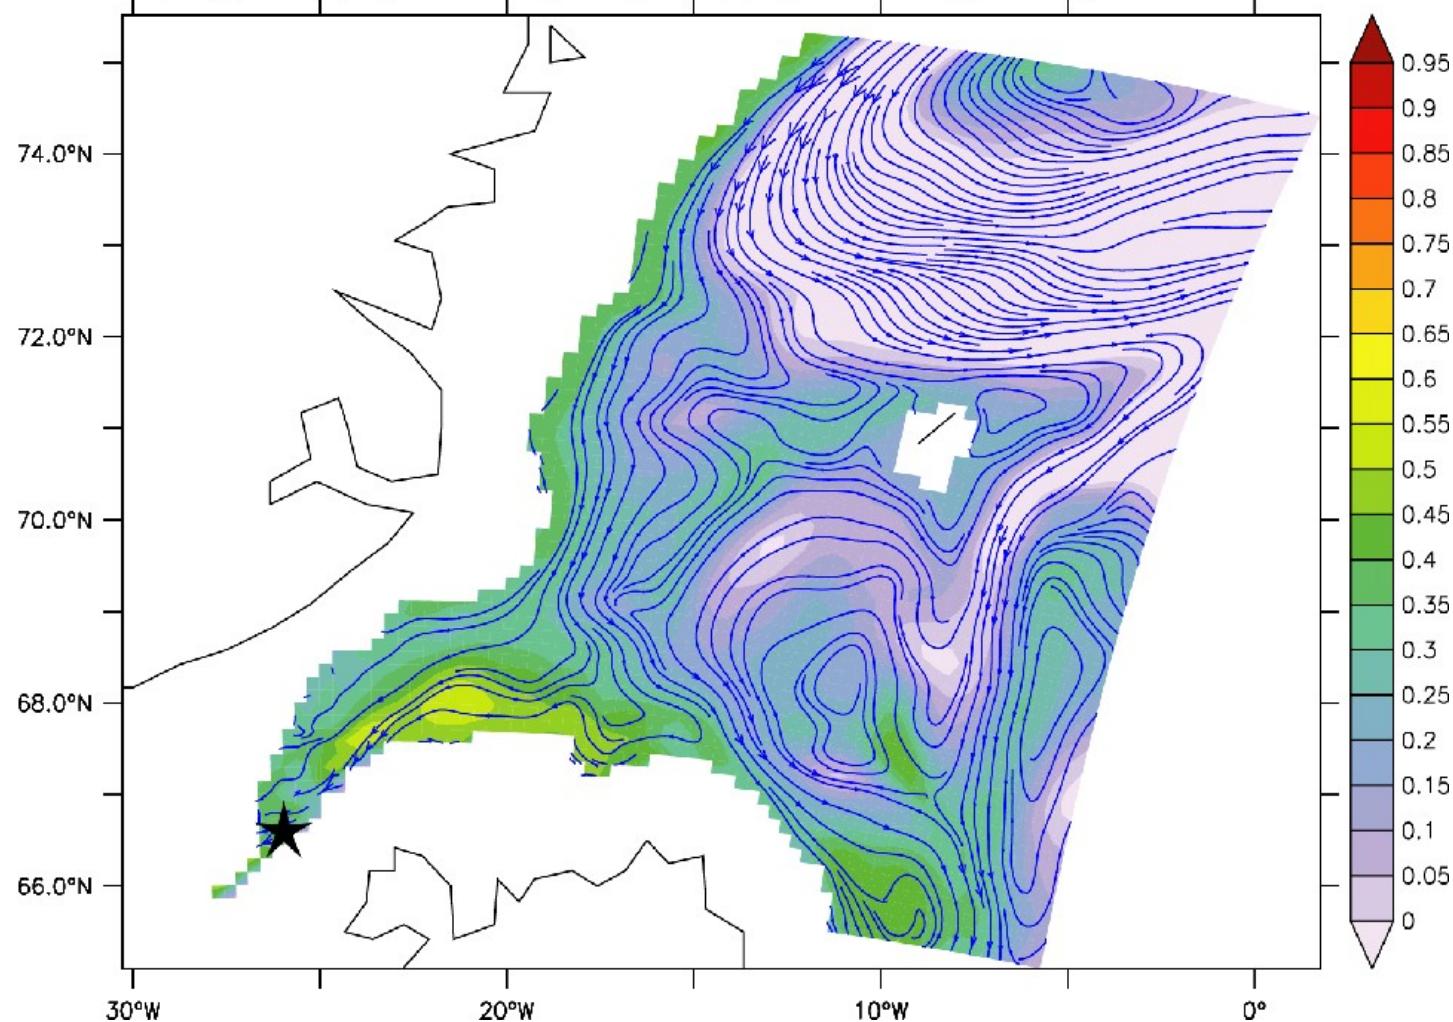

Corr(sigma_0[z=534],sigma_0[z=534]), lag=-4

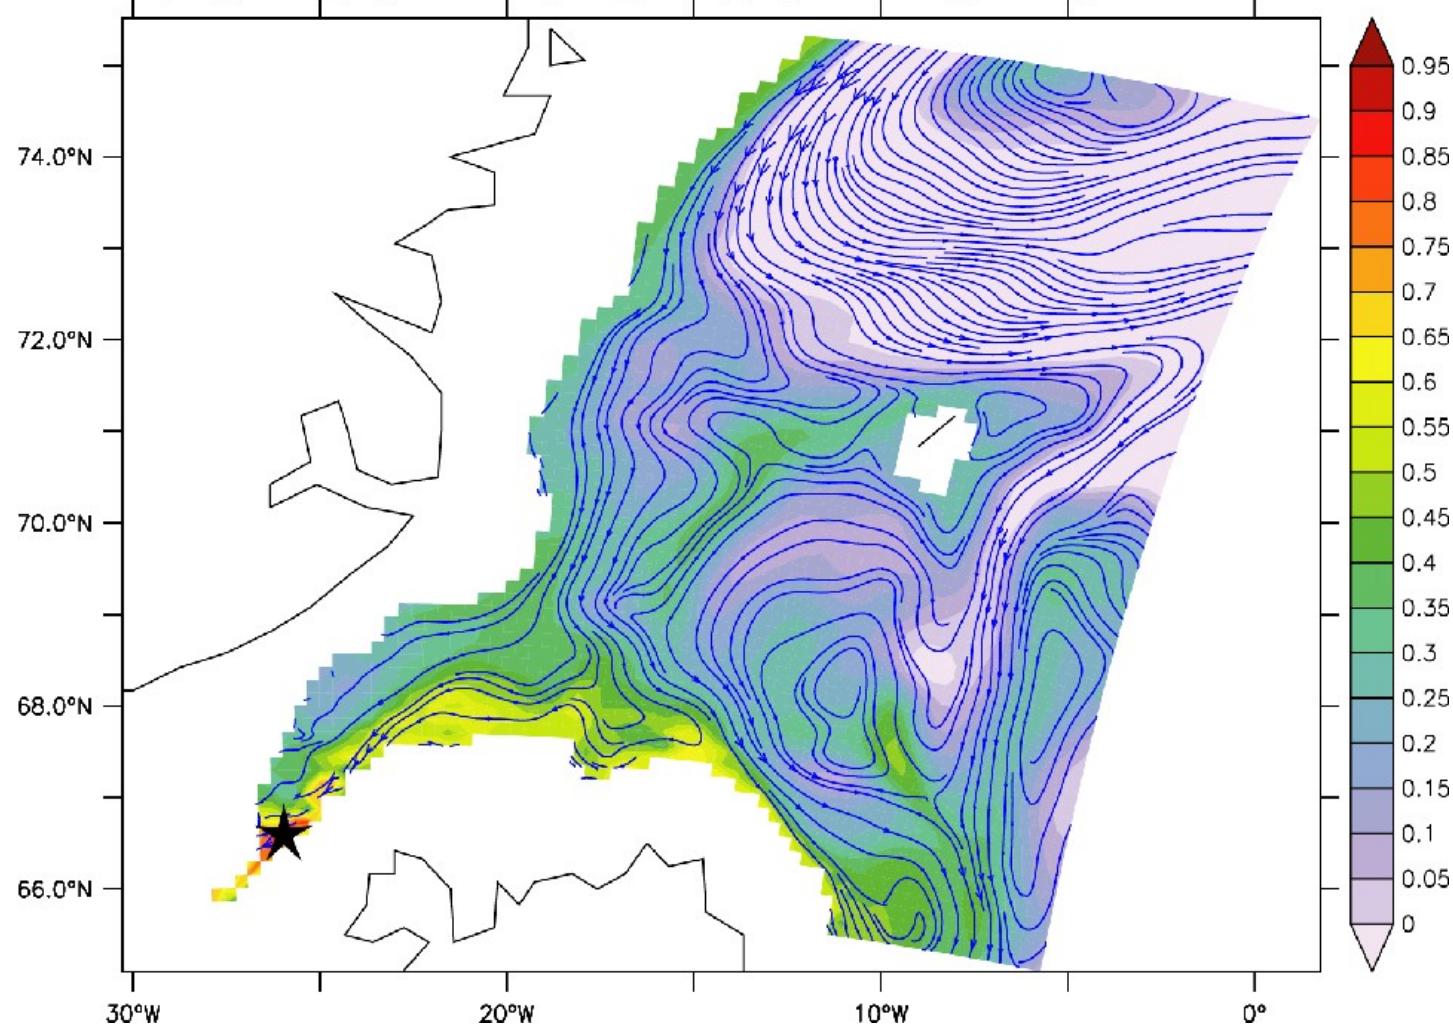

Corr(sigma_0[z=534],sigma_0[z=534]), lag=-2

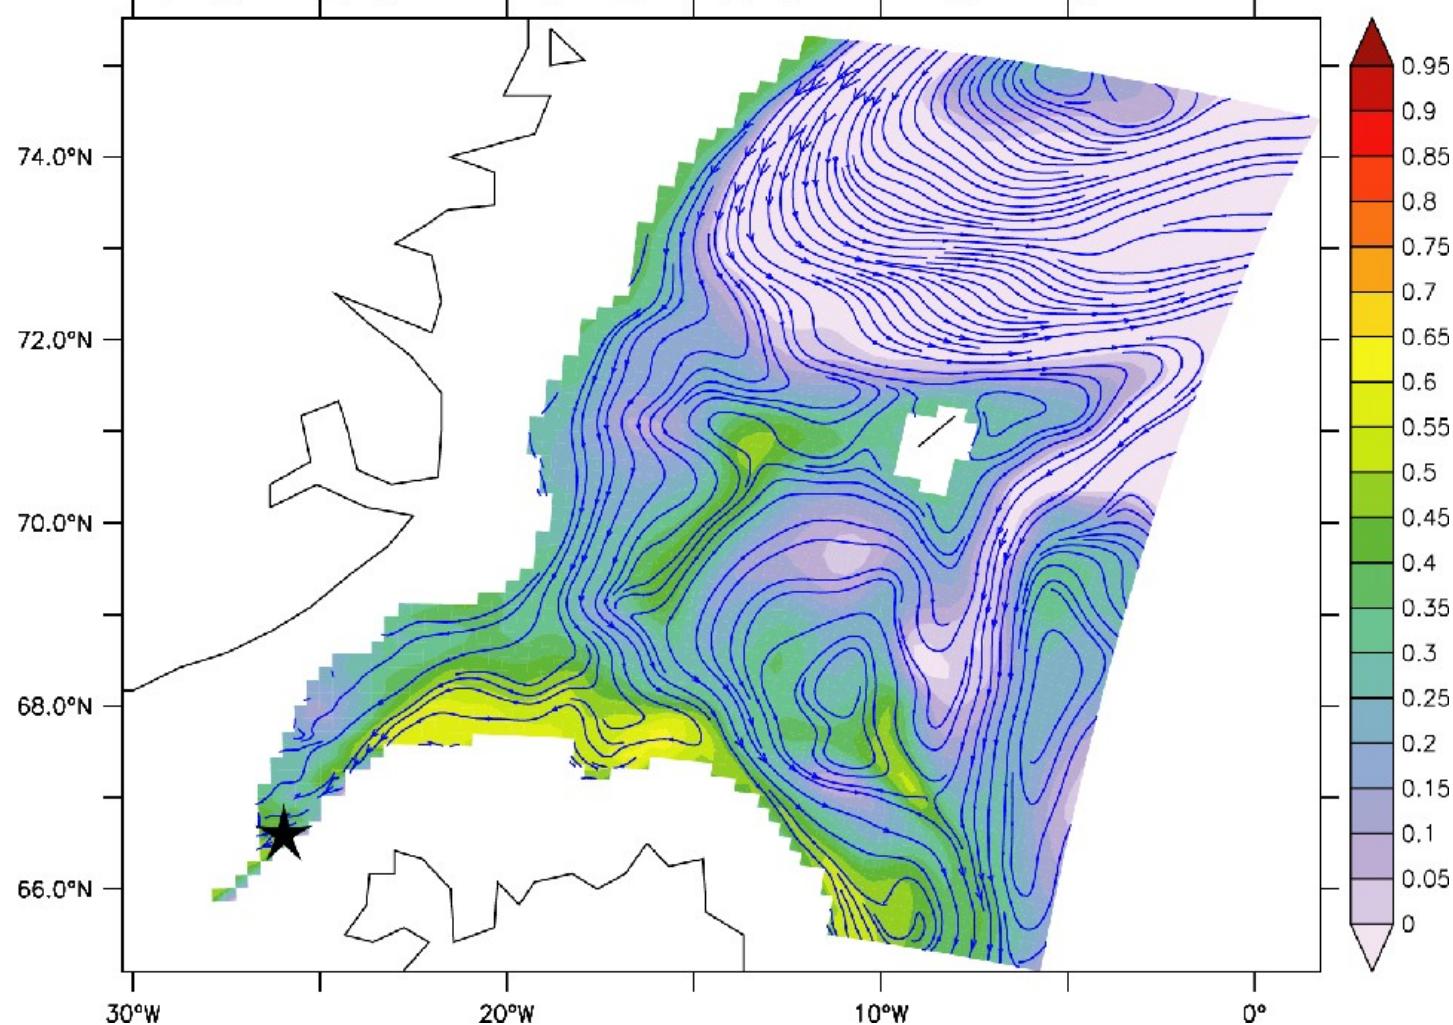

Corr(sigma_0[z=534],sigma_0[z=534]), lag=0

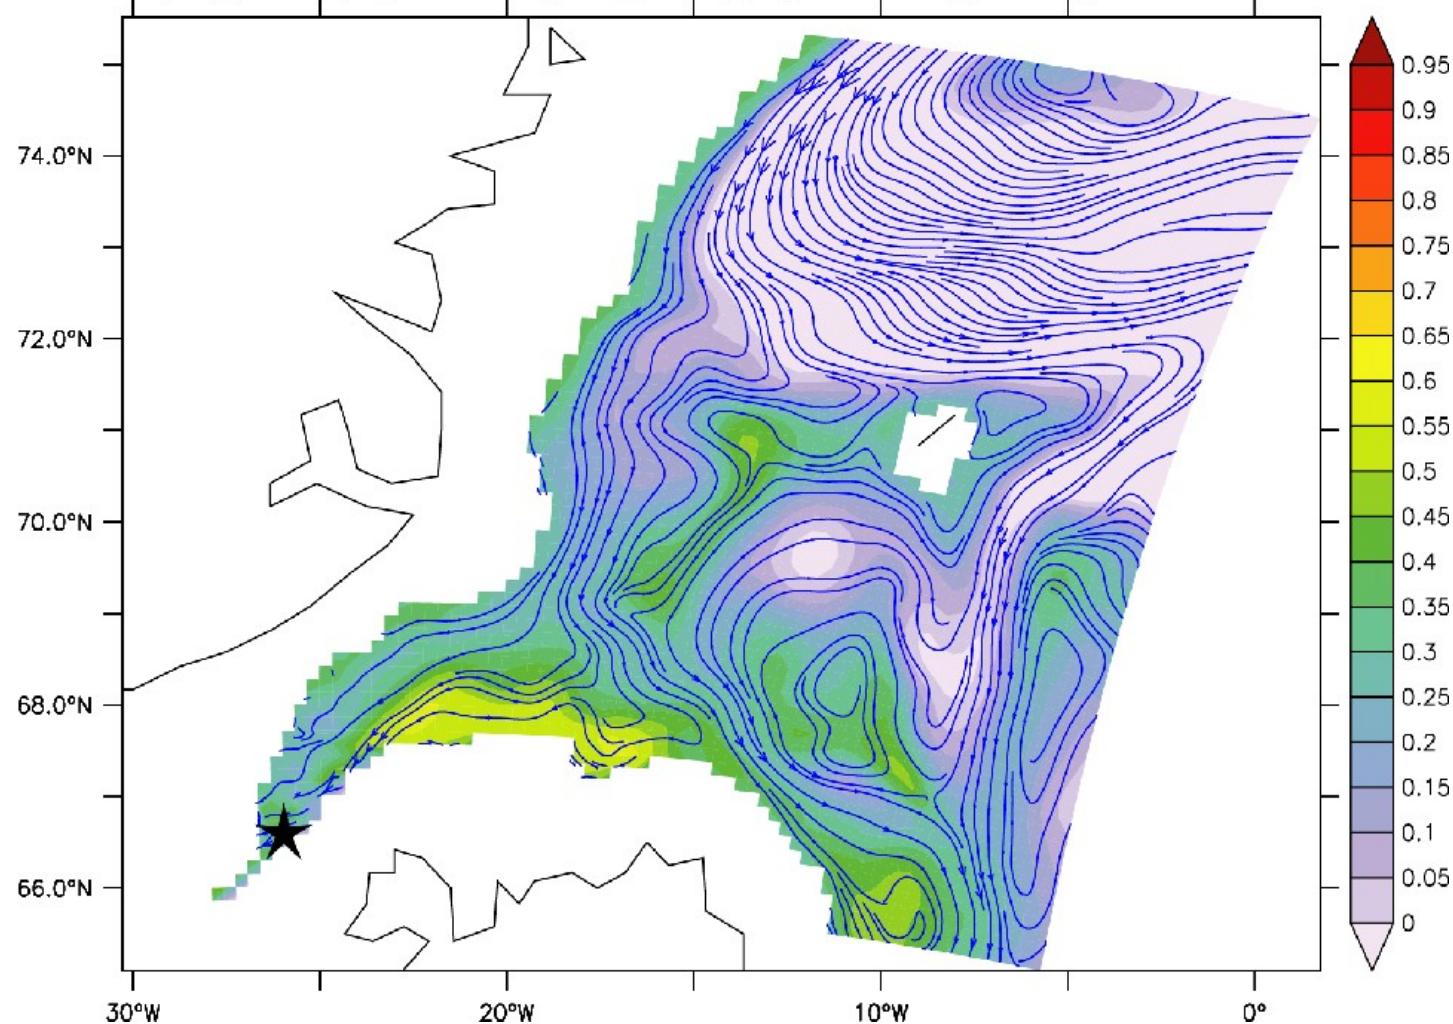

Corr(sigma_0[z=534],sigma_0[z=534]), lag=2

Corr(sigma_0[z=534],sigma_0[z=534]), lag=4

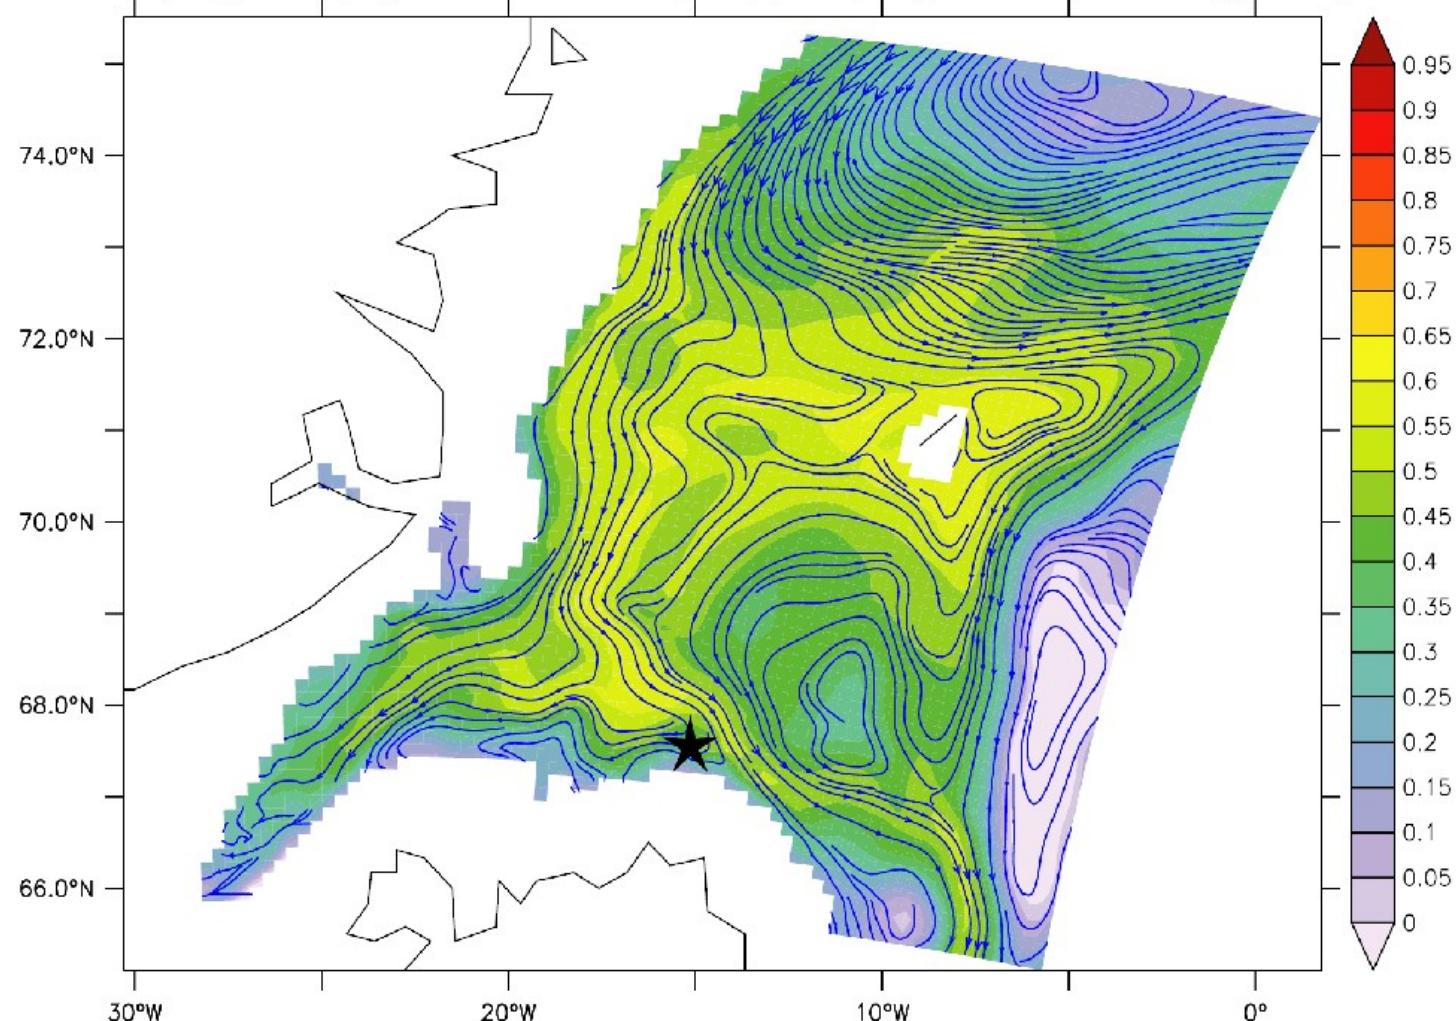

What feeds the NIJ and where does it go to?

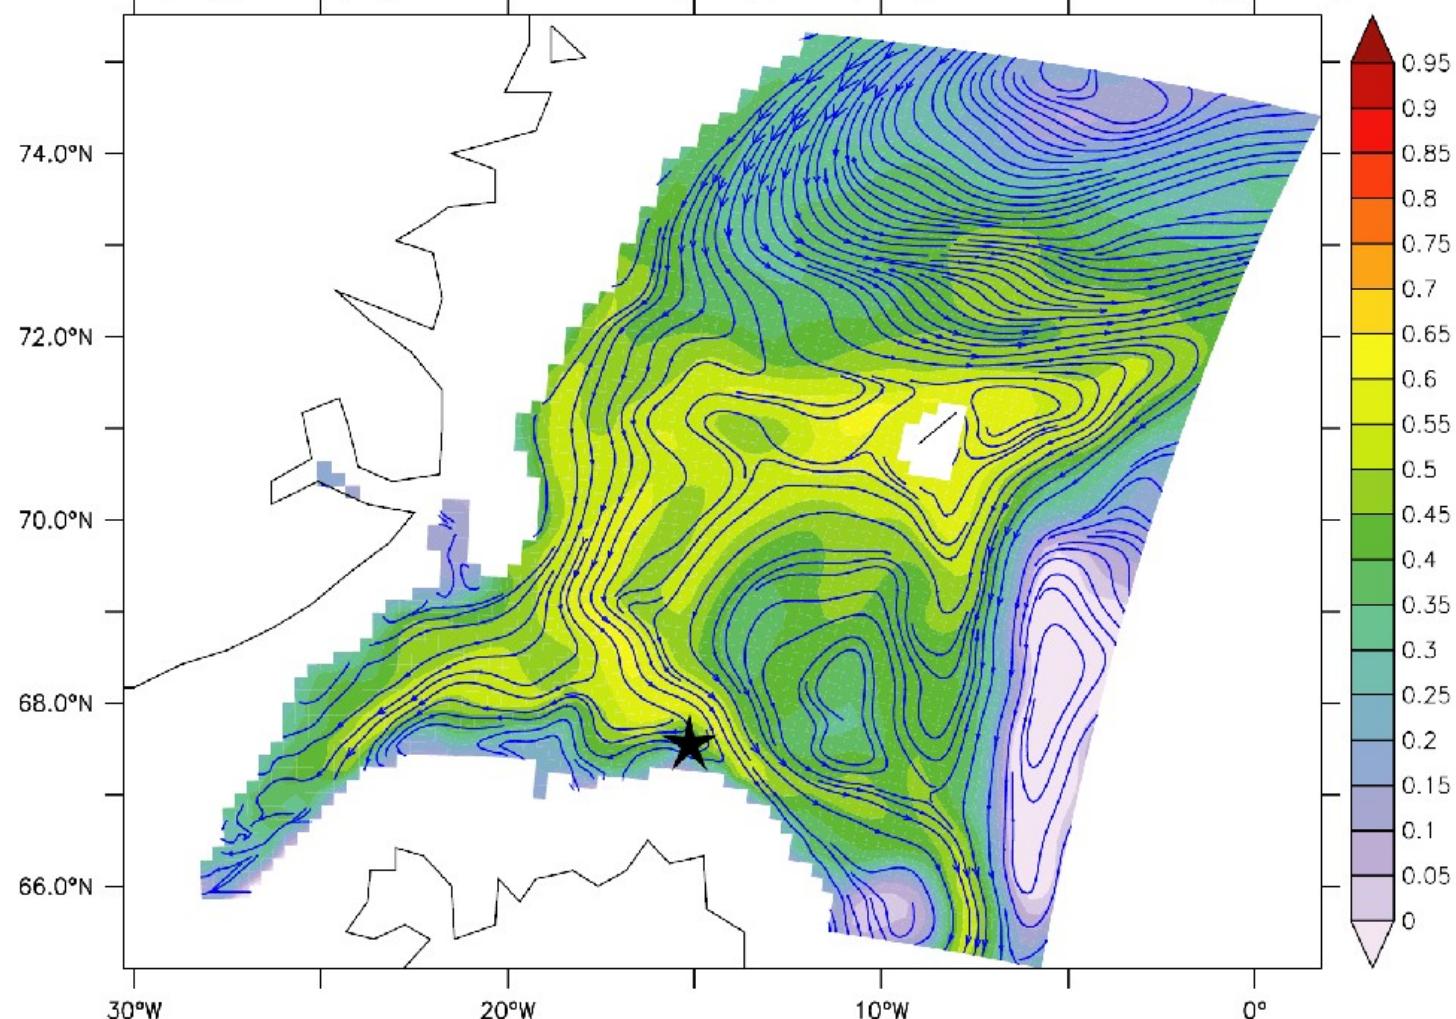

Corr(sigma_0[z=382.1444],sigma_0[z=382.1444]), lag=-6

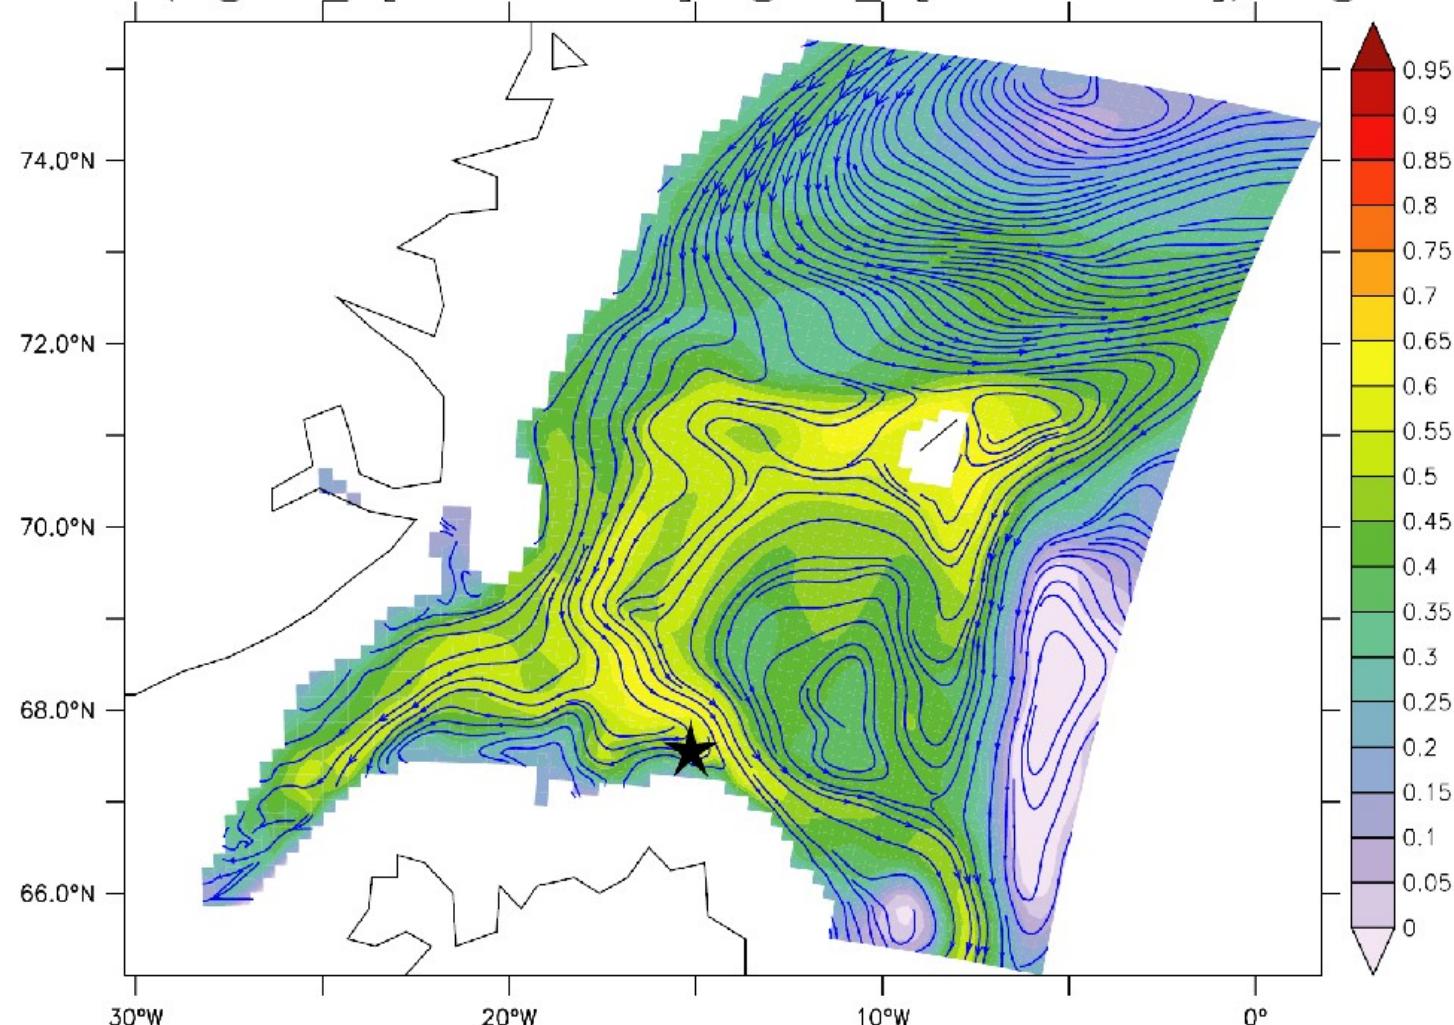

Corr(sigma_0[z=382.1444],sigma_0[z=382.1444]), lag=-4

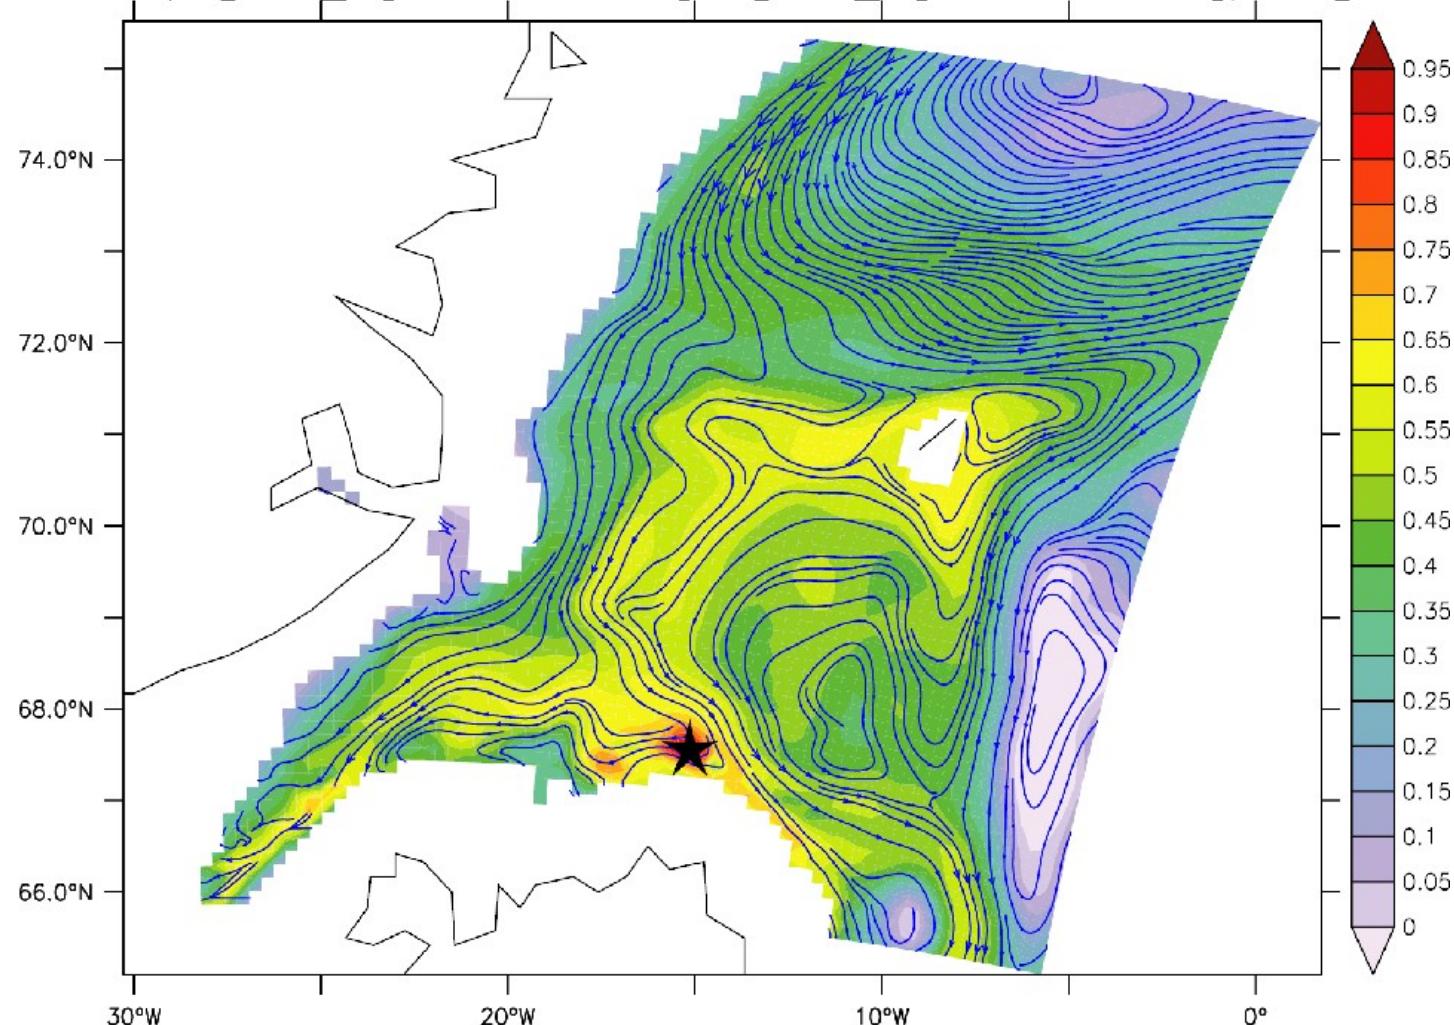

Corr(sigma_0[z=382.1444], sigma_0[z=382.1444]), lag=-2

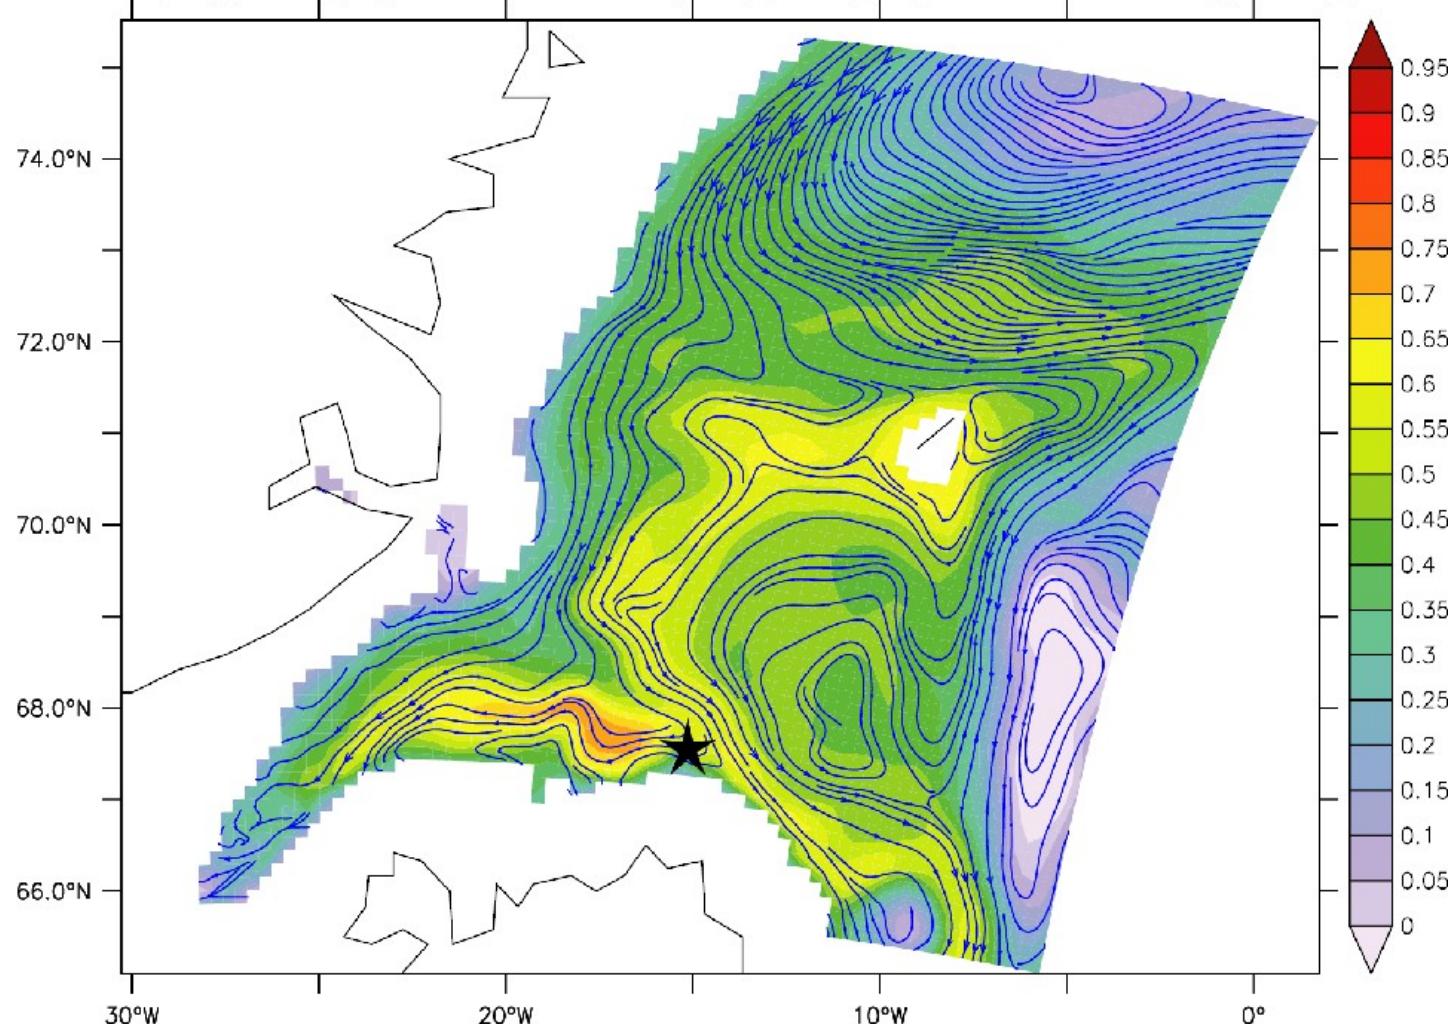

Corr(sigma_0[z=382.1444], sigma_0[z=382.1444]), lag=0

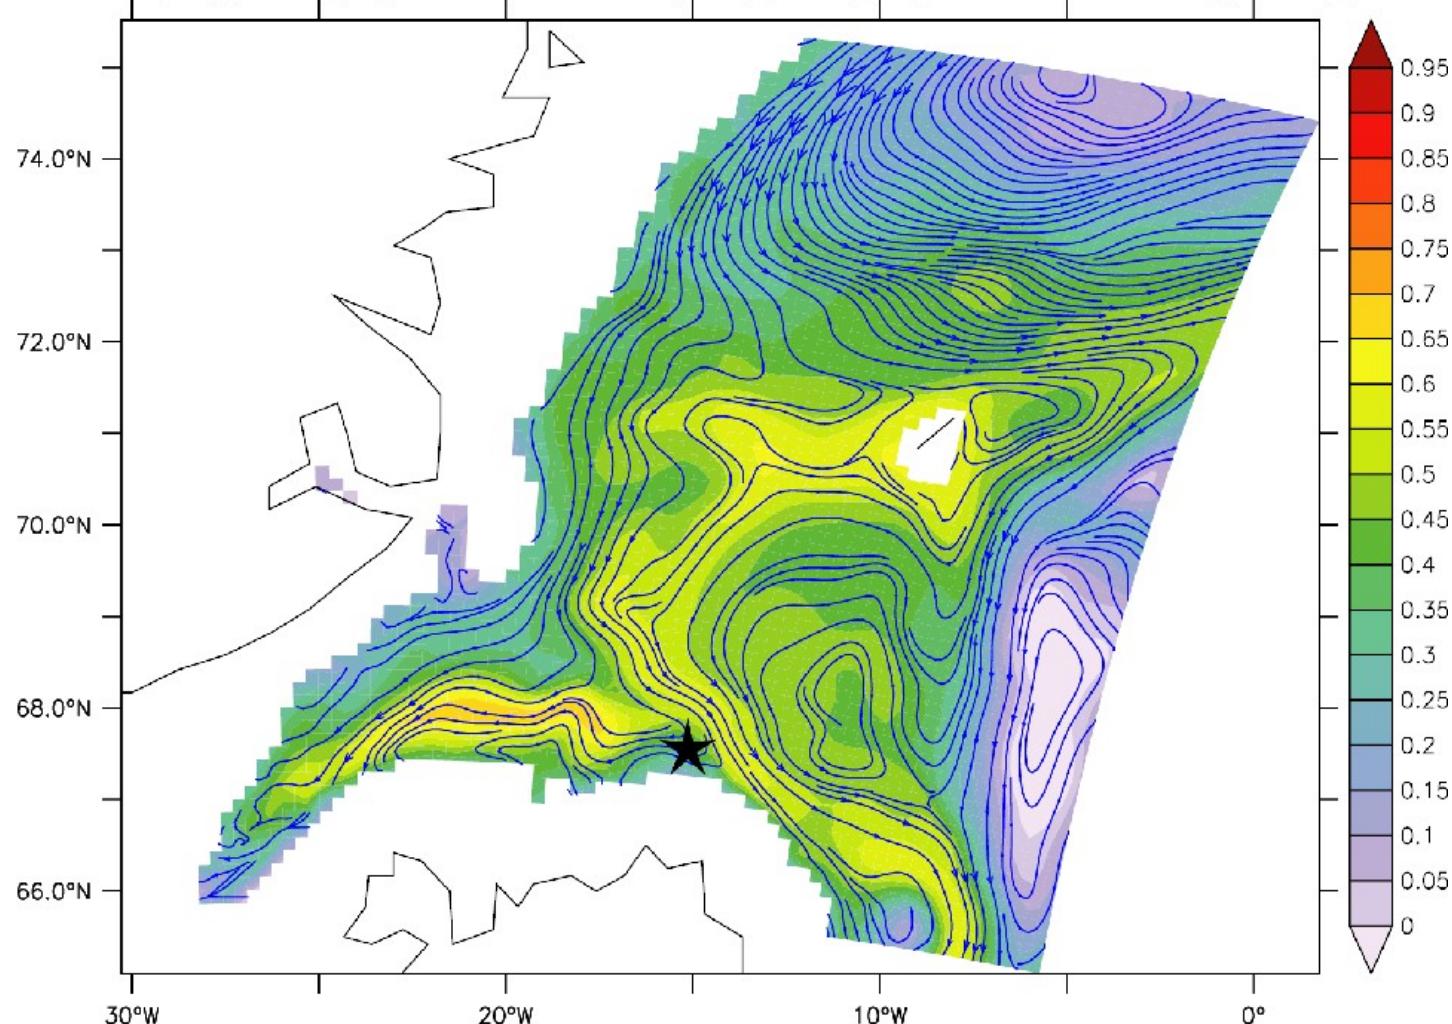

Corr(sigma_0[z=382.1444],sigma_0[z=382.1444]), lag=2

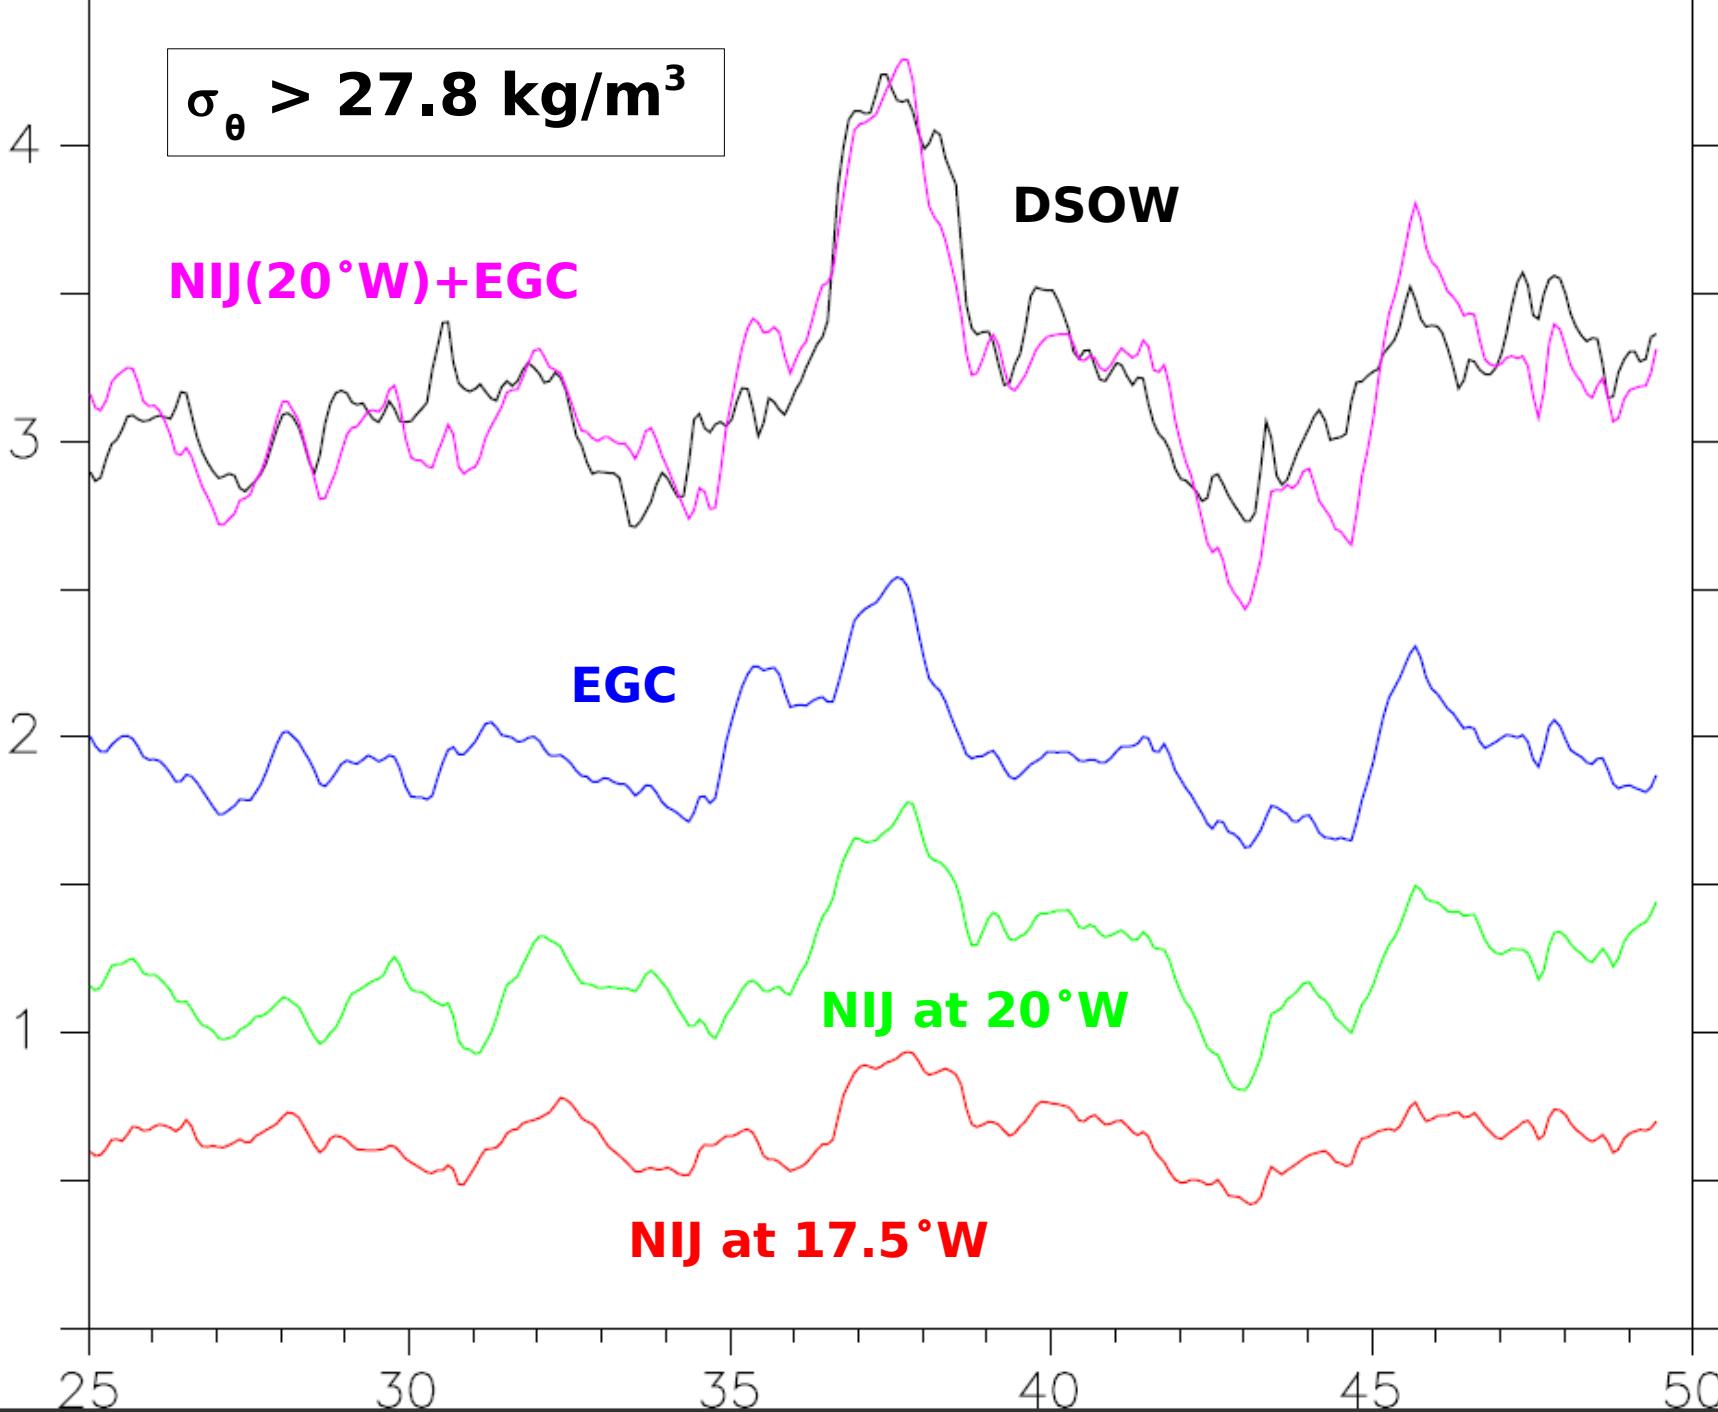

Corr(sigma_0[z=382.1444],sigma_0[z=382.1444]), lag=4

Vertical transport (Sv)

Summary

- No interaction between NIIC and NIJ (diff from Våge et al., 2011)
- NIJ is fed by Nordic Seas rim current
 - kind of loop
 - water from interior mixed in?
- 1/3 of DSOW from NIJ, other 2/3 from EGC
